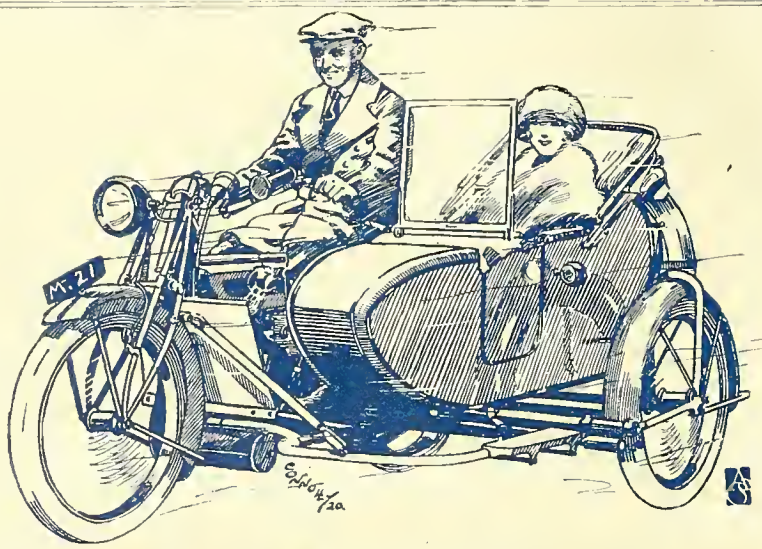
"A machine for every rider."

1921

OMEGA

A po tcard will bring you full particulars of Omegas, and also name of nearest agent.



EVERY class of rider is catered for in the 1921 Omega Range. The best material, used in the best way, make Omegas the best for every need

From £50 to £170
—each the best in its class

W. J. GREEN, LIMITED,
OMEGA WORKS, COVENTRY.

London Agents: Bartlett's, 93, Gt. Portland St., W
B'ham & District Agents: Gough's, 183a, Broad Street, Birmingham.

COPYRIGHT—REGISTERED AS A NEWSPAPER FOR TRANSMISSION IN THE U.K.

An Expert's Opinion

"In genuine de luxe high-power outfits, probably no better value exists anywhere than the model H Matchless. The specification of this superb outfit includes a really proved spring frame, three-speed, all-chain transmission, spare and interchangeable wheels, efficient mudguarding, and the sweetest-running V Twin engine ever produced. Its price is £205. No Yankee production comes anywhere near this Britisher either as regards first or running costs."

Thus wrote "Ricardo" in the "Irish Cyclist and Motor Cyclist," Dec. 15th, 1920. Take an expert's advice and "Make it a Matchless." You will find that the machine lives up to its name in every way. Ask your nearest agent about it

Price £205

for the present, and no possibility of reduction.

The A.C.U. and the Cycle Car.

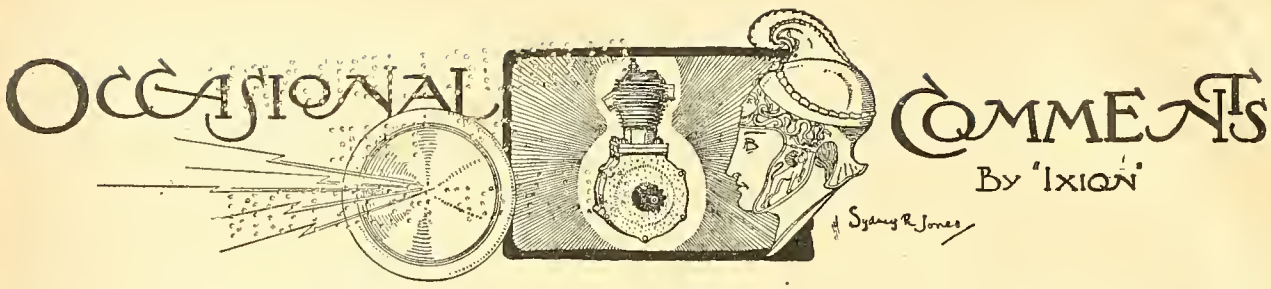
AS recorded in our issue for December 23rd a movement is afoot to transfer the cycle car once again to the control of the Auto Cycle Union. It will be recalled that prior to the war the cycle car type of vehicle was under the wing of the motor cycle body, but, owing to the lack of proper definition, the type developed into the light car, and so brought about the post-war decision to make a clean cut between cars and motor cycles, by making the deciding factor the number of wheels. This, it has been proved, was a little too sweeping, and the last car shows revealed the absurdity of terming a four-wheeled motor cycle a car, and so giving its manufacturer no option but to exhibit his miniature air-cooled four-wheeler with the cars; while three-wheeled cars were staged at the motor cycle exhibition.

Further, there is the question of taxation, which compels the owner of a buckboard to pay on the £1 per horse-power rate, while three-wheeled cars up to 8 cwt. are only subject to a flat rate tax equal to that on a motor cycle with sidecar.

Again, since the R.A.C. has had control of the four-wheeled cycle cars, *it has done nothing to encourage their development*, and, if the truth be admitted, a body interested in vehicles which cost from £500 to £5,000 cannot be expected to be enthusiastic concerning a type which is to all intents and purposes a rearranged motor cycle.

The R.A.C. and Cycle Cars.

That the cycle car as a type deserves encouragement is patent to motor cyclists: that it needs developing carefully is equally plain. In the hands of the R.A.C. it is expected to compete on level terms with fully developed cars; with the A.C.U. as its sponsors it could be developed side by side with the class of machine with which it is intended to compete, *e.g.*, the sidecar.



To justify their existence, small light four-wheelers must prove themselves to be at least the equal, on the score of economy and reliability, of modern sidecar machines and three-wheeled runabouts. For cycle cars to compete among themselves would prove nothing to the prospective buyers they are intended to satisfy; the only way to prove their capabilities is to allow them to compete side by side with all types of economical passenger machines. Whether three, four, or six wheels are used does not matter so long as "costs"—first cost and running costs—represent the governing factor.

In some of the earlier Six Days Trials, notably in 1913, for instance, great interest was aroused by the inclusion of a cycle car class; the performances of the few which were then able to enter were decidedly informative, and, provided that proper limitations as to type were fixed, the makers of genuine go-anywhere light four-wheelers would have better scope in the A.C.U. trials for a convincing public demonstration of their machines than they have at present under R.A.C. control.

A Proper Definition Wanted.

Everything considered, there appears every reason why the Auto Cycle Union should have the control of cycle cars *provided a proper definition is arrived at*. It is our firm opinion that weight must be one important factor, and since three-wheeled cycle cars are limited for taxation purposes to 8 cwt. unladen, this weight would provide a convenient line of demarcation. In addition, it would be necessary to limit engine capacity, and in this connection 1,100 c.c. seems to meet all requirements when applied in conjunction with a weight limit. Incidentally, this practically lines up with the definition of the International Federation of Motor Cycle Clubs, of which the A.C.U. is a member, the F.I.C.M. definition including 350 kilogrammes, or 770 lb., and 1,100 c.c. engine capacity. Abroad, cycle cars conforming to these two limits are taxed as motor cycles, and who knows but that with the cycle car again accepted as an alternative to the motor cycle our own revenue authorities will not take the same commonsense view?

An Index to the advertisements in this issue will be found on the page facing the back cover.

Prospects for 1921.

IN spite of the tightness of money and slack trade all round, 1921 promises to be a great year for motor cycles. Trade may recover sufficiently by the summer to restore the prospect of considerable purchases by the better paid artisans, especially by the young bachelors among them. Whether that happens or not, lots of people who intended to buy cars cannot afford to do so in these days of heavy taxation, and thousands of owners will step down from the car-owning class into our ranks. I quite expect that the motor car industry is in for a poorish time; but I hope for something approaching a boom year in the motor cycle industry.

Develop the Cycle Car.

IT follows that the cycle car has a unique opening. In 1914 the cycle car was outflanked on one wing by the motor cycle and on the other by the light car. When you could buy a sidecar *de luxe* for £125 and a 10 h.p. water-cooled four-cylinder car for £175, the cycle car had no room to develop. In 1920 a big outfit cost rather over £200, and a light car was listed at £500 or so. This gap left the cycle car a range of £300 in which to spread itself. The G.N. and the Morgan were about the only cycle cars which were ready. The R.A.C. and the A.C.U.—controlling four and three-wheeled cycle cars respectively—could do nothing much to develop or advertise either type, for the simple reason that the trade could not furnish entries for any trial which might have been held. So the public adopted a somewhat cynical and sceptical attitude towards all new cycle cars. 1921 ought to see a really colossal trial of cycle cars. The London-Exeter is symptomatic. It attracted over thirty cycle car entries, although the New Hudson three-wheelers and other newcomers were not ready for it. Now if I were seeking to market a new cycle car, I should rather funk the Exeter run. It is a stunt which tests the driver enormously, and allows his shortcomings (if any) to overshadow the intrinsic excellence of a machine. If a trial so unattractive to a wise sales manager, held before the season has commenced, and before the factory has got into its stride, can draw thirty odd entries, how many can we reckon upon for a rationally organised cycle car Six Days next summer? Let us hope that the R.A.C. and A.C.U. will agree together to render such an event possible.

A Muggy Christmas.

I LEARN from a thoroughly sodden colleague that the London-Exeter men experienced a sloppy trip once again. For myself I spent what the locals call a "whisht" Christmas. In lieu of the iron earth and frost-bediamonded hedges which figure on Christmas cards, the temperature out of doors was about equal to that of an air-cooled cylinder at 500 r.p.m. Rain fell steadily, and the walls of the house streamed with moisture inside and out. In lieu of the historic Yule fare our mournful party sat down to stewed rabbit and barley-water. Why, do you ask? Have I had the sack? Not yet. I am saving up to pay the licence duty on my stud of motor cycles. That is why I call it a muggy Christmas. We are mugs to let the bureaucrats wipe their feet on us. [Please excuse "Ixion." We happen to know he has seized up his gear box through forgetting to oil it; and he is always peevish when he has done something silly.—ED.]

Steady Prices.

THE fact that prices are becoming stabilised will help the trade more than anything else; a *steady* price is every bit as desirable as a *low* price. The other day I went out to lunch. *En route* I stopped at a garage to buy petrol, and congratulated the proprietor that his stock was so small, illustrating as a contrast the sixteen obsolete cars which I had seen in another garage, all taken in part payment for 1920 cars, and all practically unsaleable except as "junk." The proprietor pulled a wry face. "Yes, that new 1920 sidecar outfit is all I have in; but I've dropped £18 on her already, for her retail price was reduced at the Show to less than I paid for her wholesale." I arrived at my host's for lunch to find him the unhappy owner of two small cars, the prices of which had been reduced £55 and £125 respectively since he bought them. That sort of thing is just about over now, thank goodness. It makes people hesitate to buy, it engenders colossal depreciations, and it breeds bad blood all round. Announcements like the G.N.—"Our price cannot be reduced, and will not be reduced"—make for all-round confidence in trading.

Lubrication Again.

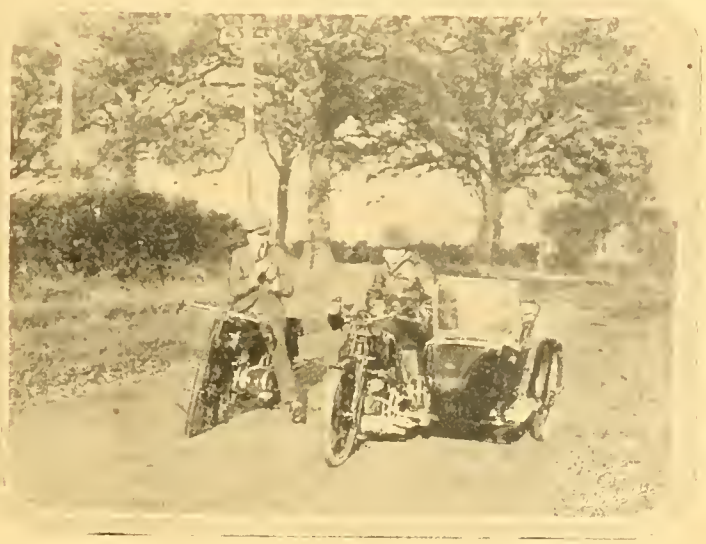
I AM glad to have the support of such an authority as Mr. Batten in my complaints about most of the current lubrication systems. Expert motor cyclists are undoubtedly quite content with the drip feed and the hand pump. But the experts hardly number more than 500 or so, and there are considerably over 100,000 motor cyclists. The vast majority hate the eternal fiddling which any rider-controlled system of lubrication implies. Such systems are tiresome enough on a single; they want attention whenever the load varies—15 m.p.h. through a town, 45 m.p.h. along a flat straight, 20 m.p.h. over a twisting road under trees, 30 m.p.h. up a steep grade—every

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Occasional Comments.—

change of circumstance calls for a variation of the oil control. The setting which is right when you start out with a cold tank may be wrong when the 'bus has warmed up a bit. The setting which is right with one grade of oil is wrong with another grade. The setting which is correct in the blaze of the noon-day sun is false when night brings down the frost. On a twin-cylinder matters are even worse. In, perhaps, a majority of such engines the oiling is always unequal, as between the cylinders; a slight error of judgment in either direction leads to sooting up the plug of the lucky cylinder, or starving the piston of the unlucky cylinder. Most motor cyclists are "eternally fiddling" with their oil supply, and hate the job. All car owners dismiss the lubrication from their mind for the rest of the day, after they have once verified the supply prior to starting out.

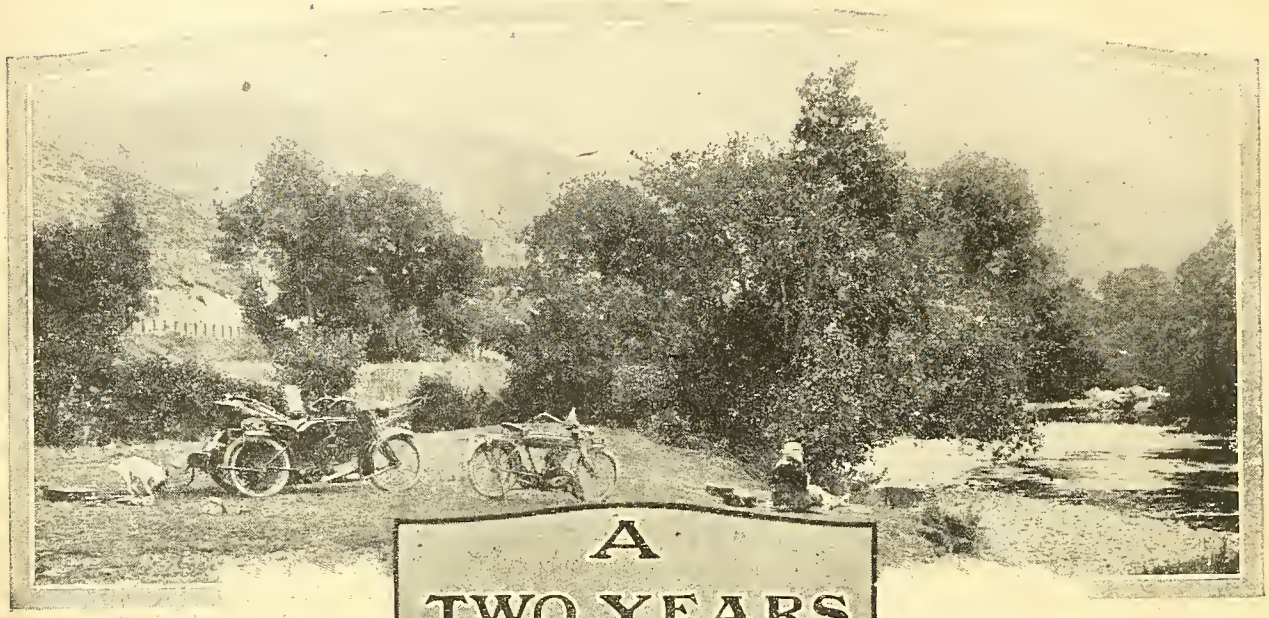
Hope for the Future.



UNTIL quite recently it was certainly impossible for designers to offer motor cyclists an out-of-sight and out-of-mind oiling system, for engines wouldn't stand it. Phosphor bronze bushes—and those on the small side, especially where the big ends of twins were concerned—tended to get too hot. Pistons and cylinders of pre-war design were often subject to appreciable distortion. Successful firms hesitated to face the risk and expense of altering a saleable model. Floods of cold oil were useful in camouflaging several crudities of design, and in obtaining good results from cheap methods of manufacture.

Then the aero engine taught us how to reduce the possibilities of distortion. Ball and roller bearings came into more extended use. When I first tried the original 3 h.p. A.B.C. experimental machine, I put the point to Mr. Bradshaw. He agreed in principle, and promised to fit sump oiling, sufficient for a month's riding. He has never confessed why he changed his mind, and finally adopted the drip on his first post-war machine. But the Zenith stand at Olympia showed that he has been reconverted. In pre-war days "oil-cooling" was a term of reproach; if Mr. Bradshaw succeeds in his campaign for exalting it into a merit instead of a crime, hand-controlled oiling will die. In the meantime I denounce it from the standpoint of practical convenience.

An Object Lesson.



NOT long ago, on a very cold and frosty night, I was driving one of the few twin-cylinders which is fitted with a separate drip for each cylinder. It was bitterly cold, and I had arrayed myself in seven changes of raiment, and toasted myself brown before a great fire ere I started out. I had previously run the engine free in my garage, and adjusted the oil feeds perfectly. Within five miles a plug oiled up. It was pitch dark and I had no inspection lamp. I hastily put in a clean plug, which oiled up some five miles further on. Having no other spare, I was now compelled to clean one of the dirty plugs, and eke to identify the cause of my troubles. Not being a novice I was able to achieve this task fairly rapidly, in spite of the darkness; and in ten minutes I was on my way again. A novice would never have reached his destination under the circumstances. But it is humiliating to reflect that such a *contretemps* could not possibly befall any car on the road, except as the result of piston ring trouble, which is naturally very uncommon.

NATURE'S TRANSFORMATION SCENES.

A study in contrasts. The lower picture depicts a Brough rider and the driver of a big Rex outfit on the road at the beginning of December. The former wears no coat, and both enjoy the sunshine amid the autumn leaves. Then comes the December snow, changing dark greens and browns to white, and, as shown in the upper picture, the sidecar driver hurries on his way.

A TWO YEARS TEST

Over 10,000 Miles without a Roadside Adjustment. Experiences with Two A.J.S. Outfits in England, Scotland and Wales.

TWO years ownership of anything, whether the object be animate or inanimate, enables one to form a pretty accurate conception of its good and bad points. To the man who has ridden motor cycles for fifteen years or more, two months would be more than ample time in which to detect evil points in design or manufacture; and bad design and material in motor cycles are abominations indeed. So to find the same make of machine in the garage after twenty-four months of motor cycling is a sufficient indication of the high esteem in which I now hold this particular motor cycle.

Taking Over.

On a biting cold day in the early part of 1919 delivery was taken of one of the first A.J.S. outfits installed with the Magdyno lighting and ignition, and a rough ride home from the makers in the darkness of a late winter's night was a foretaste of the most pleasurable two years' riding I have ever experienced.

The outstanding feature of the A.J.S., without doubt, is its absolute reliability. On starting out I can always depend that my journey will be completed without a mechanical stoppage of any description. Tyre troubles are inevitable, but I have been singularly immune, taking into consideration the fact that a spare wheel is not carried. My contention is that, as the wheels are so easily detachable, it is unnecessary to carry a spare wheel for thousands of miles on the off-chance of requiring it once or twice. If a spare wheel is utilised, the puncture must eventually be repaired; and it is a peculiar but recognised fact that punctures often come in batches. A spare tube is always carried, and can be inserted in practically the same time that it takes to change a wheel. Seven years' experience with detachable wheels fully confirms my views, however unusual they may be considered.

The smooth running A.J.S. is exceedingly light on tyres, and 3,000-4,000 is the average mileage obtained on the back cover.

Up to the time of writing not a single puncture has occurred during the 5,600 miles covered this year, and only one was experienced last year, although 7,000 miles were registered.

A noticeable feature is that the tread of all the covers wears evenly on the centre, proving the perfect alignment of the sidecar.

We frequently hear of a rider becoming so attached to a particular machine that he keeps it several seasons. But the craving to test new productions always prevented me from becoming obsessed with the merits of one make of machine. There is always a temptation, however, when the time comes, to select the mount for the coming year to "have a change," no matter how well the past machine may have behaved. Although the 1919 A.J.S. served me as no other machine had done, there was a sneaking desire to try out another make. But, even so, I once more found myself with the familiar black and gold outfit, and I willingly admit the year's riding has amply justified the decision.

A Heavy Haul.

The later model is only different in one or two minor details, but the engine is more powerful, is a magnificent climber, and will haul a good load up a stiff gradient on top gear in a way no 8 h.p. engine I have previously possessed would do. Considering the cubic capacity of the engine is 749 c.c. only, this must point to exceptional efficiency.

To illustrate the power of this machine, the following incident that occurred during the summer may be related. On one excursion we had occasion to descend the Sychnant Pass, near Conway, and noticed a coupé

A Two Years' Test.—

light car stranded on the roadside about half-way up the hill. Returning three hours later, it was still there, and we pulled up to see if any assistance was required. It transpired that the trouble was such that could only be remedied in a garage. Though the owner had appealed to several passing motorists, he had been unable to obtain assistance to get him into Conway.

An offer to make the attempt was eagerly accepted, but there were grave doubts in my mind as to the ability of a 5-6 h.p. sidecar to haul a car up this stiff gradient. A rope was procured, and, to my surprise, the machine started off apparently without an effort, and completed the task into Conway. The engine showed no signs of over-heating, and the incident gives a good indication of the power developed.

Springing and general finish of the sidecar are good, and there are none of the annoying rattles and noises so often heard when one strikes a pot-hole. A point which generally attracts attention is the mud-guarding, and in practice it is specially efficient.

On the 1920 model a single-lever Amac carburetter was fitted, and it seems to suit the engine very well. The consumption has not been less than 50 m.p.g., but with the class of spirit we get in these days it may be considered a fair average. With this carburetter the engine will just tick over, and gives an increase in speed throughout the whole range of the throttle opening, the acceleration being remarkably rapid. It appears to be very sensitive to impurities in the petrol, and the presence of a trace of water in the carburetter has a choking effect. The cleaning out of the filter and carburetter at once removes the trouble.

SIDECARING IN ENGLAND, SCOTLAND, AND WALES.

(1) The roof of Central Wales—the A.J.S. on the mountain road near Berwyn mountain.

(2) On the banks of a famous salmon river—the Tweed.

(3) The heights of Malvern, overlooking the great plain of England.

No matter how silent an engine is when new, tappet and other noises often develop after a few thousand miles' running. Not so with the A.J.S. It is as quiet and sweet running as when first delivered; and it is noted as a silent machine. The wheel bearings, too, bave stood up to their work splendidly. I usually expect the front wheel bearings to go, sooner or later, owing to the side thrust, but no trouble has arisen on either machine, and, speaking from memory, they were only adjusted once.

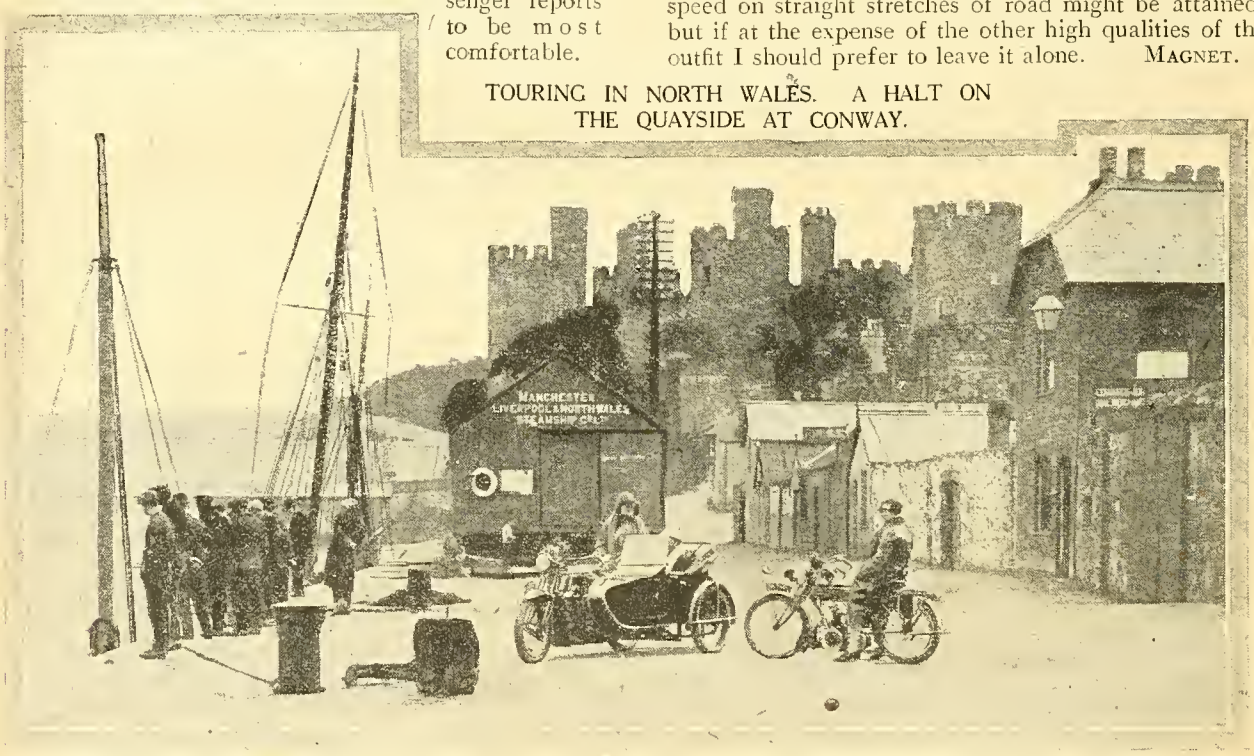
The gear box and clutch have required no attention, the gear change being silent, and the clutch smooth.

A word regarding the Lucas Magdyno lighting set, with which both these machines were fitted, is necessary in justice to the manufacturers. For two years of constant use, under varying conditions, this lighting set has given unbounded satisfaction—on no occasion has it failed or caused a moment's anxiety. Several night rides in torrents of rain have been undertaken, but neither the lighting nor ignition apparatus has

A Two Years' Test.—

suffered in the least degree, an excellent testimonial to the weatherproof qualities of the Magdyno, and the effective insulation of the various leads to the accumulators and lamps.

After nine months' use the plates in the accumulator appear to be in finer condition than any that I have ever had in use for a similar period.



The amount of distilled water necessary to make up for loss by evaporation was only about a teaspoonful in each cell, and the top of the accumulator was perfectly dry, there being no loss of acid by spilling. This is rather remarkable when one considers the amount of vibration encountered owing to the present state of some of the roads. At the same time it speaks well for the design of the accumulator, and also for the springing of the sidecar, which the regular passenger reports to be most comfortable.

It will be noted from the illustrations that the head lamp is carried on the fork and not on the handle-bar. Here again theory had been proved wrong, and the makers of the machine assured me that the lamp filament would not stand the vibration. During the two years with the Lucas and four years' previous experience with another make, no breakage of filament has occurred when the lamps have been carried in this position.

In conclusion, no machines have given less trouble than these two A.J.S. outfits. After an extensive use of any particular machine it is usually possible to find some points where improvements might be suggested, but with the exception of a desire for slightly higher h.p. and consequently higher gear, I fail to find any point I could criticise.

With a larger engine on long journeys a higher speed on straight stretches of road might be attained, but if at the expense of the other high qualities of the outfit I should prefer to leave it alone. MAGNET.

TOURING IN NORTH WALES. A HALT ON THE QUAYSIDE AT CONWAY.

MIDWAY STANDS: Some of their Advantages and Disadvantages.

THOUGH there is a good deal to be said in favour of midway stands, this position, nevertheless, has its drawbacks, chief among which is that it is difficult to bring into operation. One of my mounts is fitted with a stand placed just abaft the crank case, and, with the machine resting upon it, the rear wheel is clear of the ground, while the front wheel rests almost unloaded, *i.e.*, the stand practically supports the entire weight of the machine; while the average rear wheel stand supports rather over half the weight of the machine. Note, then, that in hoisting a motor cycle on to a midway stand, one is wrestling with a much greater dead weight than if the stand occupies the usual position.

Another disadvantage of the midway stand is that it is awkward to get at—that is, if it be of the spring-up variety. One has to reach forward with one foot in order to scotch the stand, which is a most uncomfortable and unnatural position when, at the same time, a physical effort is required to hoist the machine backwards and upwards.

I consider that the advantages of the midway stand are rather outweighed by its disadvantages unless—and this is the crux of the whole matter—it were so designed as to be brought into operation by the pushing down of a lever with the foot.

Alternatively the P. and M. method is quite satisfactory—a midway stand which entirely supports the front wheel in addition to the ordinary back wheel stand. This is a much better arrangement than the separate front wheel stand, which is in the way when tyre repairs are necessary.

Summing up, then, the further forward a stand is the more weight it has to carry, which is in its favour, except that, unless special provision be made, it enhances the difficulties mentioned. H.M.B.

PER ARDUA AD—EXETER.

The 1920 M.C.C. London-Exeter-London Run, December 27th and 28th.

Retrospective Impressions of the Double Journey.

The leaders of the London-Exeter Twenty-four Hours Christmas Run of the M.C.C.—P. W. Moffatt (3½ Douglas) and H. Karslake (5 Brough). Though competing, these two intrepid motor cyclists acted as travelling marshals. The official timekeeper's car is seen on the right, the arm of the law on the extreme left!

THE whys and wherefores which impel some two hundred otherwise normally-disposed individuals to embark on the annual M.C.C. Boxing Night run from London to Exeter are hidden deep in the psychology of the human mind. It cannot be the craving for adventure alone, for there is nothing great nor spectacular in being stranded on Salisbury Plain in a blizzard or a downpour, with either tyres or lamps that "won't keep up"—there is nothing but discomfort; cold, clammy and dank discomfort.

Wet and Warm.

The night of December 27th, 1920, was unlike London-Exeter nights of previous years, only in so far as the south-westerly rain-bearing wind, was warm instead of bitterly cold; the rain was there in no half-hearted fashion—none of your gentle rains that gladden the earth, but a downright soaker, insinuating itself into necks and wheel bearings with equal impartiality.

Staines was the usual scene of intense animation for an hour or more before the first man's start at eight o'clock. The yard of the garage and the garage itself were packed with competing machines, to which their riders were adding finishing touches or affixing the club's cardboard number plates. Garage attendants pushed through the crush of weirdly-dressed men bearing large tins of oil or petrol. Here a man tried his electric set; here another made frantic efforts to persuade a recalcitrant acetylene generator to function as it should; everywhere watches were adjusted to the official timekeeper's, route cards were consulted, and coat after coat added until most riders were of twice their original size. Just before 8 p.m. the line formed under the flare of acetylene projectors and the feebler rays of the street lamps, with vivid intermittent bursts of flash lights for photography, flashes that left everything in utter darkness for a few seconds. All hoped that the fair promise of the day's weather would be kept, but over the stars already was stealing an ominous blue-black group of heavy clouds, first harbingers of the storm to come.

A few miles from the start, and ere the tail cars of the procession had cleared Blackwater, rain fell very heavily indeed, and existence for the solo riders became trying, the more so in that the roads speedily turned into lakes of mud of a particularly nasty consistency. Numbers rapidly became the pulp from which they originated, overalls and Sidcot suits turned a shiny dark brown, and many so-called waterproofs became ominously leaky at the joints. In such circumstances no one relished the passage over the Plain from Andover, and quite a number of competitors availed themselves of the open, warm garage at the latter town to linger while their machines were filled with petrol, and to obtain a little really hot coffee. Over Salisbury's dreary plain the run was just as bad as anyone could have imagined, and it was difficult to keep upright, so fiercely did the gale beat upon the riders, the gusts growing every moment more fierce, as the last of the sheltering trees gave place to the bare road leading almost into Salisbury.

Salisbury.

Despite the fact that the hour was late and the rain heavy a great crowd of spectators watched the arrival of the competitors at the White Hart, and much interest in the machines was dis-

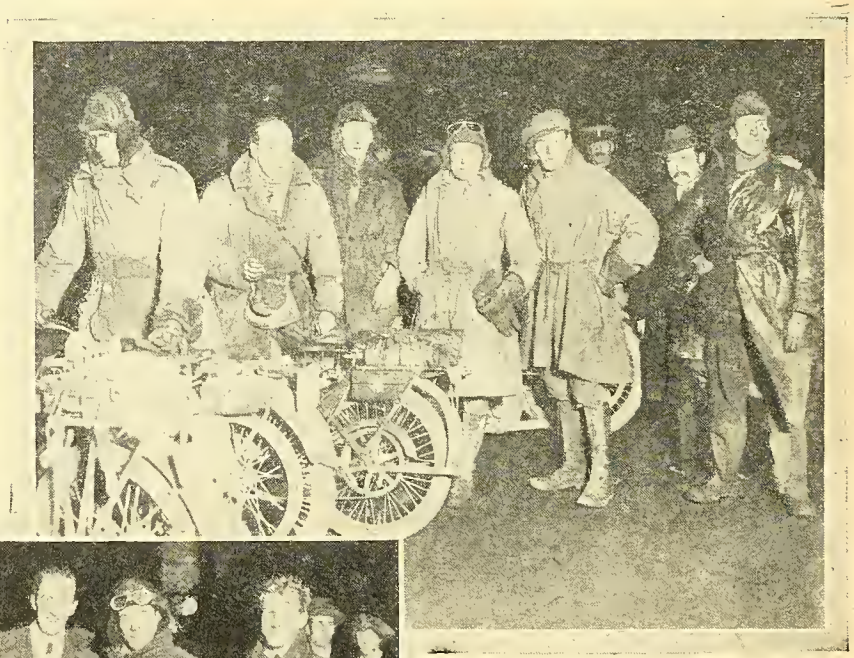
B.

Per Ardua ad—Exeter.—

played. A great variety of lighting equipment was noticeable, especially amongst the solo mounts. The N.U.T.'s and A.B.C.'s were brilliantly illuminated with their Lucas electrical equipment, and electric lighting was decidedly more popular than anything else: but quite a number were using Fallolite projectors with acetylene cylinders. These lamps give a rather curious effect, as their beam is long and narrow and the lamp itself at close quarters appears to be very dim—until one peers directly into its lens, when a blinding glare is observed, as the inevitable enquiring persons discovered to their discomfort!

Over Salisbury Plain.

Starting out from Salisbury after midnight, with the rain still falling, the riders struggled against the head wind and driving sheets of water; and the sight of a string of solo tail lamps, bounding and skidding on some of the vile stretches of road, was curious. Here and there a rider without lights or with dying illumination would tack closely on to the rear of a companion, whose path was lit by a broad and brilliant beam, and so everyone ploughed gamely along to the check at Shaftesbury (first man, 1.42 a.m.), where, despite the weather, many spectators were gathered round.



The illuminated direction signs here were excellent, and one has only to ride through such a trial to appreciate the fine sportsmanship of the local man who stands half the night at a wind-swept corner tending the guttering light and shouting out directions to the passing riders—a true guardian of the flame whose devotion should not remain unnoted in a world where the less spectacular duties are often at a discount.

Easier going, both as regards weather and roads, followed to Yeovil, where a welcome cup of coffee was served with the replenishments at Moffat's garage. Mud-stained, soaked, and generally bedraggled, who amongst the riders that night could truly say that he had ever tasted a better or more welcome drink than that grateful cup?

Glorious Devon.

Onwards from Yeovil the weather took up somewhat, and anon the moon could be seen at intervals, riding amidst swiftly-travelling cloud masses. The first observed hill, Chard, caused no particular difficulty, and the check at Honiton was a mere incident in a run that tended to become a confusion of twisting lanes, hunger, side-slipping, and a desire for sleep. At any rate, the feeling that Devonshire was at last reached filled all hearts with some satisfaction, and the "new" Peak Hill (near Sidmouth) was approached by most in a spirit of detached carelessness; in consequence, a number failed.

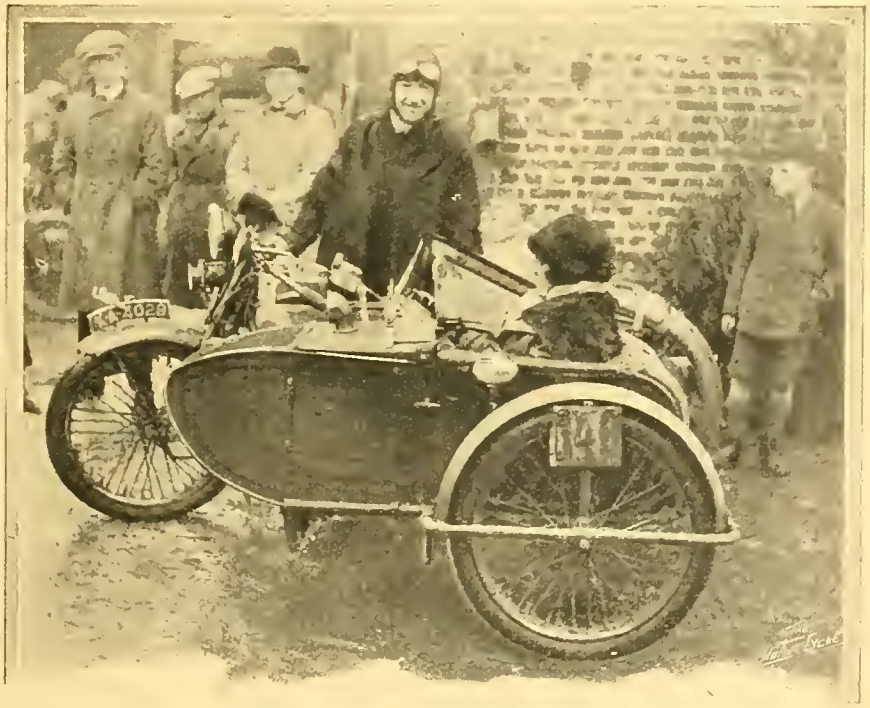
The hill is severe, probably averaging 1 in 7 for half a mile, and having a tolerably good surface. To a powerful sidecar outfit it presents no difficulty, but the drivers of some single-cylinder sidecars and solo lightweights experienced considerable anxiety, and not a few failed altogether. Even though the hour was but 5 a.m., quite a crowd of spectators had assembled at the top, and watched some 140 surviving motor cyclists, of whom about thirty failed. To mention any particular performances, ignoring the fact that it was difficult to see the passing numbers, would be invidious, but the Matchless, Harley, and Morgan machines all came up exceptionally well, while Triumph and Sunbeam riders showed the capabilities of the medium-weight passenger outfits.

(Left) R. C. Staunton (4 Triumph) was well prepared with such equipment as leg-shields and handle-bar muffs, but one wonders whether his watch continued to function after the torrential journey; note its exposed position. V. Gayford, on the Zenith, carried a useful torch around his neck, but did not make special preparations to protect his machine Between him and the rider in the flying suit is H. Watson Bourne, who finished second in last year's Junior T.T.

(Right) More examples of London-Exeter raiment. The old time Hutchinsons were conspicuously few in number, nd army field boots took their place.

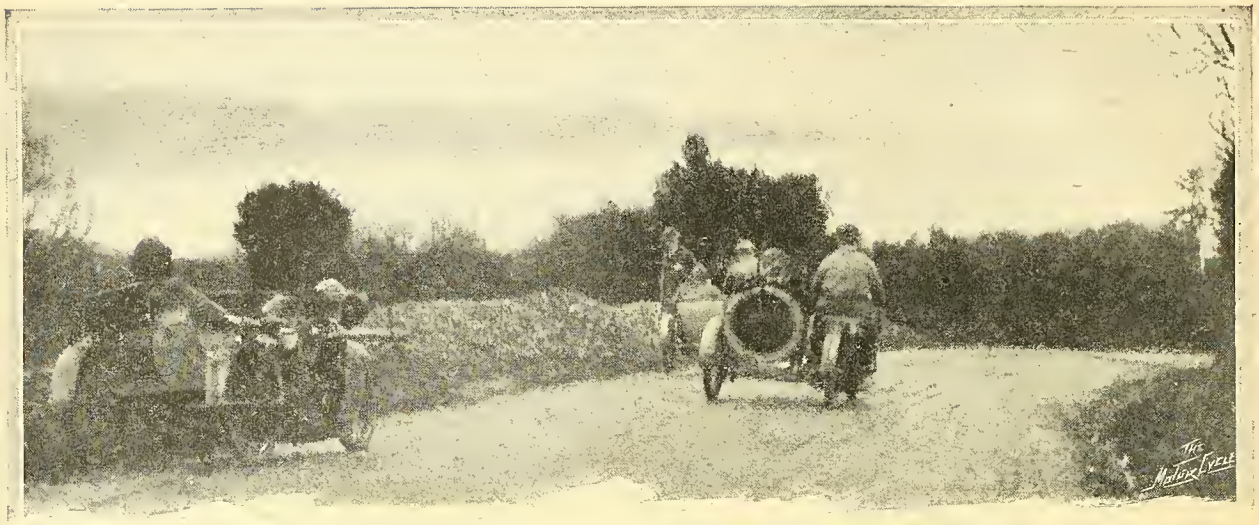
H. B. Browning (3¾ Scott) on a hill in the picturesque district round about Sidmouth

Exeter at Last.



From the top of Peak Hill, a precipitous descent, proved a specially good test of brakes, and one of the cars as well as the outfit of our own representatives, ran away down it. The former suffered some injury, but the latter scraped round the corner at the bottom by sheer superhuman effort. Sixteen miles remained, and in the light before dawn they proved trying to the soloists, since there was a large section of narrow and greasy lanes.

Breakfast in Exeter allowed sufficient time to elapse, so that the riders were able to start out again on the return run without relighting lamps, but a somewhat depleted number naturally reembarked on the journey. A glorious sunrise raised hopes which were ultimately to be dashed, and although fine weather prevailed until the Devonshire coast was left, much rain and mist were afterwards met.



Trow Hill did not seem to wear anything like the formidable aspect it presented during the run in 1919, in spite of the fact that the second bend has now been widened, and, consequently, leaving much loose unrolled metal. As against 1919, when failures amounted to 20%, there were only three or four competitors who were unable to make clean ascents. A large crowd had congregated to see "the fun," but the local enthusiasts must have been sadly disappointed. Probably Trow is now shorn of its former terrors by the widening at the top, and the M.C.C. committee for its next run may wish to seek a "new venture." To characterise individual performances would be somewhat superfluous, but in each class the following ascents were of special merit: A. Milward (3 A.B.C.), V. Gayford (6 Zenith), J. Baker (3¾ Scott), A. P. MacGowran (4 Triumph sc.), W. H. Julian (8 Matchless sc.), A. P. Pulling (6 Royal Enfield sc.), and W. P. Brandon (4 Triumph sc.).

The long descent into Lyme Regis was the next incident, and, although the scenery was charming, no one had much time to admire it; in the little town itself huge waves were breaking over the main street along which the riders passed.

The run through Dorset was again a damp one, and rain and a light mist made driving unpleasant, while the roads on the Bridport, Dorchester and Blandford section were pot-holey and muddy in the extreme. A stiff following wind over the undulating barren country between Blandford and Salisbury did not tend to the cool running of engines, especially as everyone along this stretch was making up time. A.J.S. and Matchless machines

J. D. Marvin (7-9 Harley-Davidson) was one of the few entrants who took a lady passenger to brave the elements. On the sidecar was fitted a very neat aluminium dash, equipped with clock, voltmeter, etc.

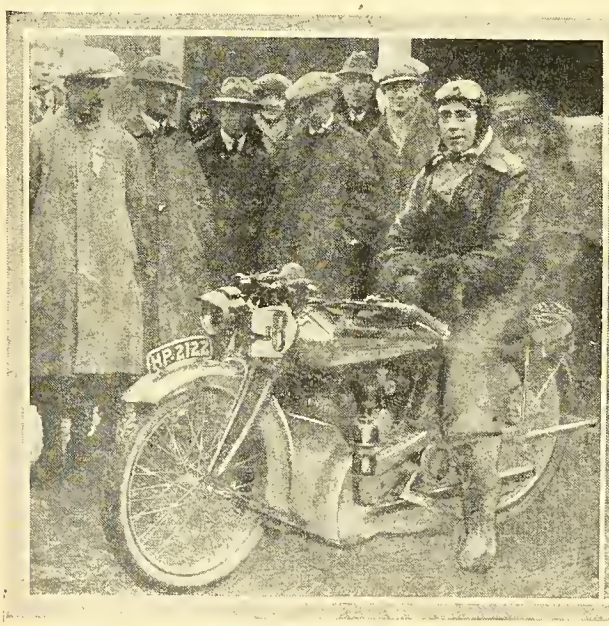
A glimpse of the sea near Lyme Regis. T. J. Ross (8 Matchless) descending towards the town

bowled along at a great pace, while the speed of some of the Harleys was extraordinary. Along the morning's run, young Eli Clarke (but 15 years old) was keeping up well, despite the fact that his 6 h.p. chain-driven Douglas was leaning in on the sidecar; the Morgans also were going strong.

Salisbury, reached once more, provided a welcome, but late, lunch interval, and many notes were exchanged anent the events and misadventures of the night. Some twelve hours ago, dim figures swathed in wrappings had been spoken to and about without knowledge of identities—now in the cold light of day Brown was recognising Jones as the begrimed individual who had chatted in the wee sma' hours at Yeovil or Honiton; the very atmosphere seemed to bear perpetual expression of "fancy meeting you!"

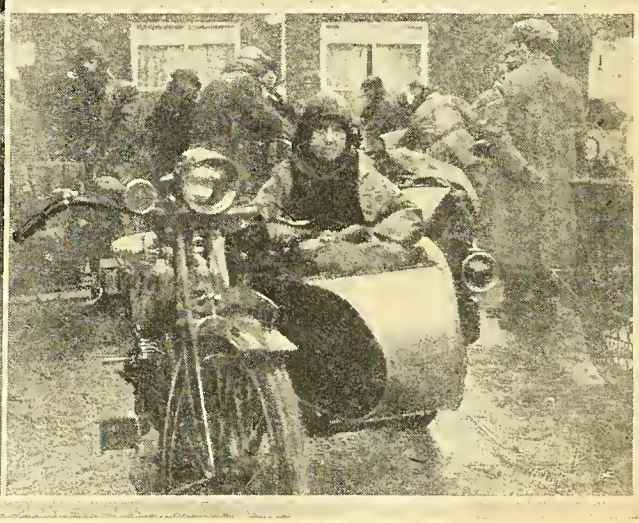
Salisbury to Andover was a welcome relief from mud and decayed roads, and finally Staines was reached again by 108 of the 152 who started out. Unfortunately the latter part of the journey was marred by a somewhat serious collision between J. Macdonald (7-9 Indian sc.) and a non-competing car.

An account of experiences by the car competitors will be found in to-morrow's issue of "The Autocar."



INCIDENTALLY—

There was almost unanimity in footwear. Fully 80% of the drivers wore field boots. Hutchinsons and trench waders were represented amongst the remaining 20%.



Congratulations to the lady passengers; also to the small boy wedged in one of the light four-wheelers, who wisely slept.

Glimpses of the sea and some very fine scenery were available around Lyme Regis. Most competitors, however, were too preoccupied with their brakes to appreciate this.

Would as many have failed on Peak Hill had it been after breakfast instead of at the grim hour before dawn?

George Brough on the new 8 h.p. Brough Superior This machine (described in "The Motor Cycle" on December 23rd) was much admired at the different controls, and, incidentally, started with wonderful ease.

Mrs. Dan Bradbury awaiting her pilot. She travelled down from Sheffield with her husband, completed the double journey, then rode back to Sheffield on their 4 h.p. Norton—a really arduous journey.

Per Ardua ad—Exeter.—

Several competitors got a straight run at Peak Hill by missing a turn, and approaching it by the beach road. The right-angle turn in the official route was doubly difficult.

It has been suggested that a platinum medal, studded with diamonds, would be a more suitable award for the solo riders who gained "golds." After watching, from the comparative security of a side-car, rear lamps that danced from side to side of the road for miles on end, we are inclined to agree.

Surprisingly few got really lost. Local clubs provided marshals and illuminated arrows on many of the loneliest corners; while just in front of the competitors an official car "arrowed" doubtful turnings with "Christmassy" tissue paper and shavings, which, however, very quickly compounded with the mud.

The coffee at Yeovil (supplied, as of yore, by Moffat's Garage) provided one of the most welcome incidents of the trial. It was timely, it was free, and it was really good coffee!

Few failures awarded the crowd on Trow, and the bioscope man wore a decidedly disappointed smile. Peak Hill, on the other hand, claimed its quota of victims (mainly sleepy drivers), and a larger attendance of able-bodied spectators would have been greatly appreciated by some weary competitors.

R. B. Whiffen, riding an 8 h.p. Blackburne, had extremely hard luck, since between Dorchester and Puddletown he was skidded into by a Ford car. His machine had been running extremely well up to that point.

An approximate census of types of clothing provides some interesting figures. Long leather coats head the list in popularity, oilskins were not so prominent, fur-lined combination flying suits were much in evidence—particularly so among the three-wheelers and cars—while not more than half-a-dozen were rigged out as conventional motor cyclists are supposed to be, *i.e.*, in a waterproof jacket and trousers.

A long article might be written on head gear; but nobody appeared to have found an ideal here. Probably a fur-lined helmet surmounted, when desired, by a chin-strapped oilskin sou'wester, provides the best compromise for "London-Exetering."

Alan Hill's 90 h.p. Itala developed a distinct aversion to gradients on the return journey, and after being pushed up one or two Devonshire pimples it was wisely decided not to attempt Trow. It was comforting to passing motor cyclists who had received their share of trouble to see the monster at a standstill.

Electricity or acetylene? Contrary to expectations in some quarters, dynamo lighting has by no means ousted the much-vilified carbide system. Next year—and despite what was said at breakfast at Exeter, there *will* be a "next year"—we expect the battle of lighting types to be still undecided.

AT THE FINISH. Some of the 108 survivors of the 152 who started, checking in at Staines. Kaye Don, who rode a Scott, signs the sheet, while E. A. Bridgman, of Indian fame, stands by beaming with satisfaction; at his elbow is T. C Greenwood—son of the Sunbeam designer. Eli Clark, the old time Bristol rider (in oilies), awaits his turn. The judge at the table is L. A. Baddeley.

PER ARDUA AD—EXETER: The Story of an Unsuccessful Competitor.

ONE hears so much of the impressions of those who get through a run like the London-Exeter with success, that it is sometimes interesting to read the experiences of one who failed to do so!

The writer, being blessed with an early number, left Staines soon after eight o'clock on Boxing Night. The rain and the wind held no terrors for him, as he was warmly clad in wool and leather, so he settled down quite comfortably to follow the tail lamp ahead of him all the way to Exeter.

Just before reaching Basingstoke the drip feed in the head lamp generator choked, and a few minutes were wasted in consequence.

Then followed the inevitable "blind" to make up time. Somewhere near Andover the writer caught up his companions, and kept with them until the outskirts of Salisbury were reached.

There a stop was made to study watch and route card, and it was found impossible to restart! A brawny spectator gave a hand, and with a push the engine fired.

At Salisbury petrol, carbide, food, and a mysterious envelope were received, and after an hour's rest the journey was resumed. Again the greatest difficulty was experienced in starting up, but eventually the engine was got going. There followed a kind of T.T. over difficult and tortuous roads, with here and there a really bad patch, and Shaftesbury was reached to time.

Here the engine stopped while route card and watch were being consulted, and once again refused to start. Happily, a large garage was open close by, and investigation led to the discovery of a stuck up rocker arm in the contact breaker.

This was soon eased off, and the engine started first kick. It was now too late for a "gold," but the rider was determined on getting a silver, so he blinded cheerfully all the way to Honiton, hardly noticing the observed gradient of Chard Hill on the way.

The exhaust pipe next came off, and a game of snap-dragon with the hot union ensued.

J. C. Walker, an Edmund rider, and C. Bourlet (3½ Ariel) awaiting their call at Staines.

A Curious Accident.

After some twisty, hilly lanes came Sidmouth, where a local workman advised the competitors that he was going to summon the M.C.C. for making a noise! Then Peak Hill—rough, but not so bad. Then some frightful lanes about 5ft. wide. Then . . . deep ruts, mud, and a fall "all anyhow" in the middle of the lane, only ten miles from Exeter!

Somehow, in falling, the inlet valve was bent nearly five degrees, so that it would go neither up nor down. The valve guide was also broken. An hour's unsuccessful work, what time the long, long trail of motor cycles and cars went past and up the hill as the sun rose. Suddenly a recollection of being very hungry resulted in the finding of a perfectly heavenly farm, with an even more heavenly Devonshire breakfast. . . .

There are compensations for everything!

H.E.S.

CLUB NEWS.

Newcastle and District M.C.

The Newcastle and District Motor Club's Friday evening gatherings at the Grand Hotel are proving very popular. Contributors to an enjoyable programme last week included Messrs. C. E. Warrington, Wicks, Battye, Wood, and others. Mr. A. S. C. Broadway presided. Speeches by Messrs. Baxter and Keir upon the intention of the North to organise an automobile association free from any connection with the Royal Automobile Club were received with great enthusiasm.

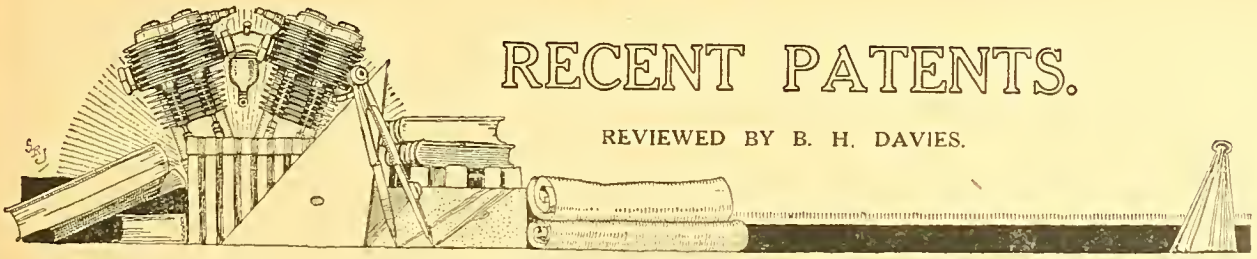
Lancaster, Morecambe, and District M.C.C.

The Lancaster, Morecambe, and District Motor Cycle Club held its annual dinner on Monday night, December 20th, at the County Hotel, Lancaster. Mr. Jos. Atkinson, of Atkinsons, Ltd., presided and it was mentioned that a motor reliability run had been held over Whiteshaw Moss, Kingsdale, during that week-end, ten completing the seventy-six miles.

A hill-climbing competition is to be held in 1921 up Langthwaite Brow. There are 106 members.

East Lancashire M.C.C.

There was a distinctly motoring flavour about the third annual ball of the East Lancashire M.C.C., which was held before Christmas at the Public Hall, Blackburn. Nearly 300 guests danced on a floor that was arrowed in correct trials manner! Added to this a number of the dancers carried hooters, etc., upon which they accompanied the Crellin Best Orchestra. Mr. W. G. Guest was hon. secretary of the event, and the M.C.'s, Messrs. A. A. F. Jerrard, H. Walsh, and W. B. Livesey, were assisted by a large band of efficient stewards.



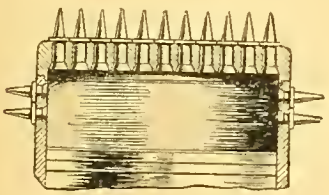
Harrogate and District M.C.C.

The Harrogate and District M.C.C.'s Boxing Day trial attracted quite a good number of entries, but, owing to fog and rain, only sixteen faced the starter. The event, extending to ninety miles, was run in four sections, each of which had to be completed non-stop, and no adjustments were allowed without loss of marks. The first section put out of the running D. Moore (4 Wilkin), who retired with engine trouble. The second section accounted for H. James (2½ Excelsior) with gear trouble and H. Hamlyn (8 Zenith sc.), who broke a chain. No casualties appeared during the third section, but evidently the riders were finding that mud and wet were intent upon causing trouble, for, no sooner had the last section commenced than D. Berry (4 Triumph sc.) had to stop to tighten his front cone. C. Mitchell (4 Triumph) had tyre trouble, and ran out of petrol, as did Eastwood on a similar machine. H. E. Ellis (4 B.S.A. sc.) had a large amount of trouble with his belt. W. Monkhouse (4 Triumph sc.) also had belt trouble. Illingworth (8 Enfield sc.) had gear trouble, and failed to finish. The observed hills did not cause very much trouble, and nobody had any complaints on that score.

The results are as follows:

SOLO CLASS.—G. Hill (3¾ Scott), non-stop; W. Atkinson (4 Triumph), non-stop; D. Brigham (4 Triumph), non-stop; H. Smithies (8 Excelsior), lost on time; A. Hill (4 Triumph), lost on time.

PASSENGER CLASS.—W. E. Grange (8 Bradbury sc.), non-stop; W. Monkhouse (4 Triumph sc.), one stop.

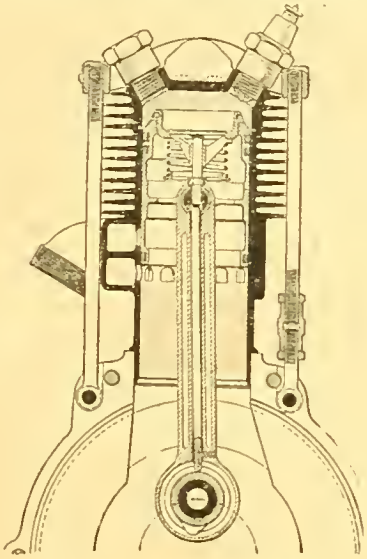


RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

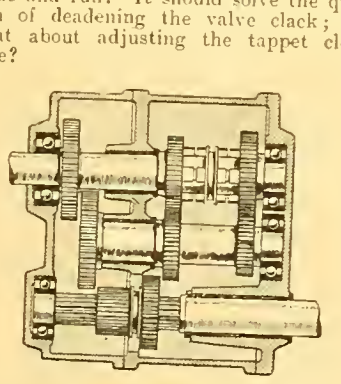
Studded Cylinders.

CAPT. W. O. Bentley is known to fame in three separate spheres. Years ago he was well known as one of our keenest competition riders. Later he raced on a D.F.P. During the war he designed what is unquestionably the best rotary engine for aeroplanes in the world—his experimental corner in the Humber works had much to do with our supremacy in the air. Latterly, he has been much wooed by sportsmen who desire early delivery of his three litre road racing car. He now appears as the inventor of a new type of air-cooled cylinder, which much intrigues my curiosity. This cylinder will obviously be expensive to manufacture. Does his always cautious nature envisage the possibility of yet another 'orrible war? Or is his fertile brain busy on a 100 h.p. air-cooled car for the sons of millionaires? Anyhow, the drawing is practically self-explanatory. Shouldered pins of a high conductivity metal, *e.g.*, copper or aluminium, are utilised to stud the steel cylinder barrel, which is made rather thicker than usual. The pins may be taper-headed, or flattened to form a continuous fin. Their shoulders are preferably in contact. They may be screwed, pressed, shrunk, or cast into



Bentley's air-cooling No. 140,286. 18/6/19.

place; in the drawing they are inserted from the outside and riveted on the inside, a final cut being taken to finish the bore. I am afraid this mode of construction will prove too expensive for motor cycles, but it may adorn the "B.R.3" in the next war.

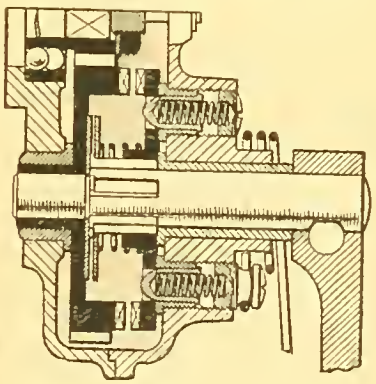


A Piston Head Valve.

I am an old cynic, and rarely lift my eyebrows when a startling phrase greets me on opening a Patent Office specification. But I rubbed my eyes hard when I struck the following: "The stem of the inlet valve passes through a hole in the small end of the connecting rod. . . ." But I wasn't nodding, as a glance at the sketch will prove. The engine in question is a two-stroke, and, like all up-to-date designers in this sphere, Messrs. Snarry and Bullows are irked by the inefficient valve timing which the conventional three-port system imposes. So they transfer the inlet to the piston crown, where they fit a poppet valve, the stem of which protrudes into a cutaway gudgeon pin. It is operated by a tappet or pushrod provided with a guide in the bore of the connecting rod, and actuated

Snarry's valve gear. No. 140,598. 27/3/19.

by a cam on the crank pin, the big end being cut away to suit. This design confers considerable freedom in timing of the inlet period. The exhaust ports can now be cut all round the cylinder, if desired; and scavenging may be assisted by shaping the crown of the pistons as a crater, from the centre of which the fresh charge erupts, driving the exhaust gases outwards towards the ring of ports. I wonder much if this engine has been made and run? It should solve the question of deadening the valve clack; but what about adjusting the tappet clearance?



Williams's change-speed gear. No. 140,566. 25/2/19.

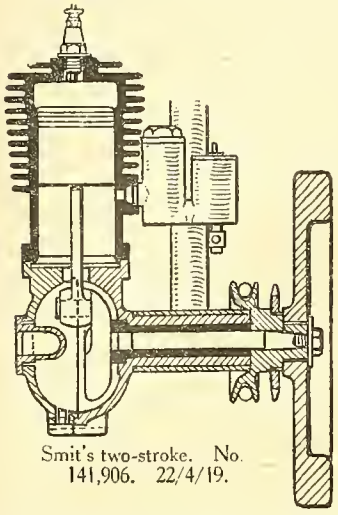
A Three-speed and Reverse Gear Box.

Mr. T. L. Williams protects the gear box shown herewith, of which the special feature is that only one pair of gear wheels are running idly on any given ratio, and that the loose wheel of the idle pair is always on the driven shaft, which is slow running. The extreme left-hand pinion on the upper or driven shaft is the reverse pinion, and the axes of the three shafts are not in the same plane, so that the reverse gear is through two wheels only. In order to keep the shafts short, no neutral position is provided between the secondary pinions for the reverse and first forward gears, and a special gear changing mechanism is suggested to prevent the dogs on the driven shaft from being engaged during changes from "R" to "1" and *vice versa*.

Kick-starter Engagement.

In Mr. J. C. Harris's kick-starter, the two pinions are always in mesh, and the larger wheel runs loose. A ratchet on its outer face matches a ratchet splined to the secondary shaft, but free to move endways along it. A spring normally holds the two ratchets out of contact.

Harris's starting device. No. 140,(00. 29/9/19.



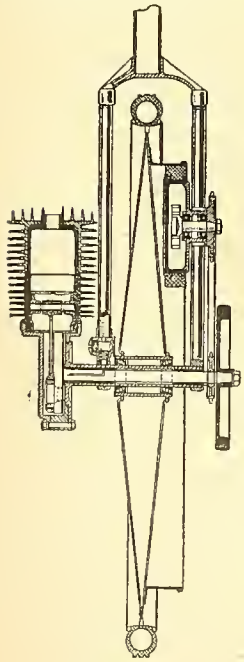
When the starter pedal is operated, the movable ratchet is forced round, and a couple of spring plungers mounted in the casting quit two oval holes in the ratchet, and bear against it, forcing it into engagement. At the end of the stroke the spring plungers regain their holes, and the main spring once more keeps the ratchets disengaged.

An Auxiliary Attachment.

Messrs. Smit and van Veen (no prize for guessing their nationality) make a suggestion which I do not think I have seen before. They propose to motorise a push-bicycle by removing the usual pedal crank from the bottom bracket and marketing a bijou engine which fits into

Recent Patents.—

the bracket, with the cylinder on one side and the flywheel and pulley on the other. I have never worked out the dimensions,

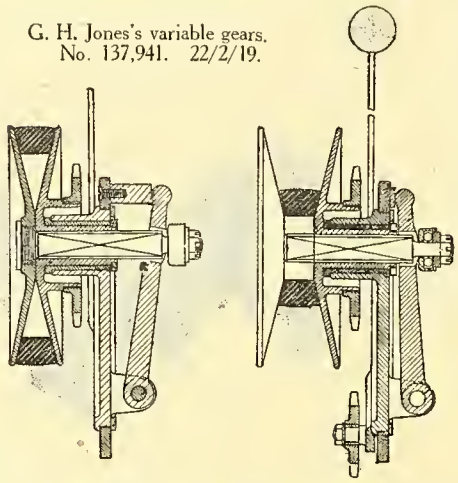


Smit's two-stroke. No. 141,906. 22/4/19.

and ha'e ma doots whether the bore of the bottom bracket is sufficiently spacious. They suggest a rope drive from a pulley on the off side of the crankshaft. Help!

The Original Cykelaid.

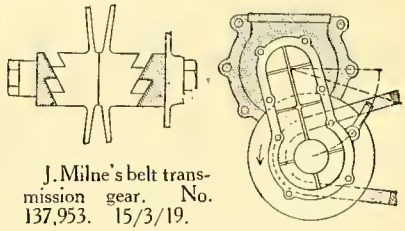
Messrs. Sheppee and Jowitt go one better than the Dutchmen. They thread their crankshaft through the hub of the back wheel; but there is this in their favour, that they can supply a special back wheel with a fat hub, whereas the last invention intends to use a standard bottom bracket. I feel grave suspicions of the drive which Messrs. Sheppee and Jowitt proposed, viz., belt from the crankshaft to a countershaft fixed to the rear forks and carrying a small friction disc rubbing on a flat belt rim fixed to the wheel spokes. This notion was tried out on a machine known as the Derby, and built about the year one. I am not prepared to say that the Derby was killed by its transmission, for it may have —probably did have — a dud engine and ignition; nevertheless, this transmission contains possibilities of trouble, which, I presume, were duly discovered, since the machine which was exhibited at Olympia as the Cykelaid was considerably modified.



F. H. Sheppee's motor attachment. No. 141,866. 19/3/19.

An Eccentrically Mounted Pulley.

A chain-cum-belt drive, embodying an expanding pulley gear, represents Mr. G. H. Jones's idea of a good modern transmission. The countershaft, which carries the expanding pulley, is mounted eccentrically upon a disc, which can be partially rotated in a carrier fixed to the frame. This allows the belt tension to

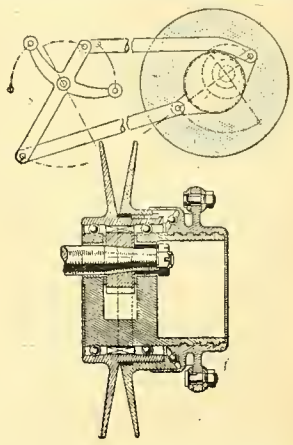


G. H. Jones's variable gears. No. 137,941. 22/2/19.

be maintained at all working diameters of the pulley. The front chain is properly tensioned on top gear, and its slack is taken up by a jockey sprocket on the lower gears. Single lever control of gear ratio, constant belt and chain tension are some of the advantages claimed for the Jones gear. An alternative construction allows both flanges of the pulley to move equally and simultaneously.

A Swinging Countershaft.

Mr. James Milne is equally attracted by the variable pulley form of gear, but his ideas approach more closely to

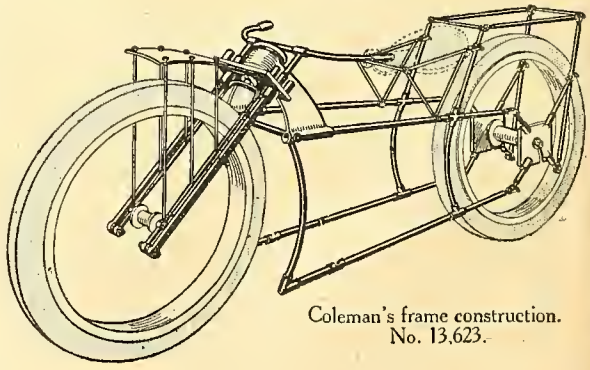


J. Milne's belt transmission gear. No. 137,953. 15/3/19.

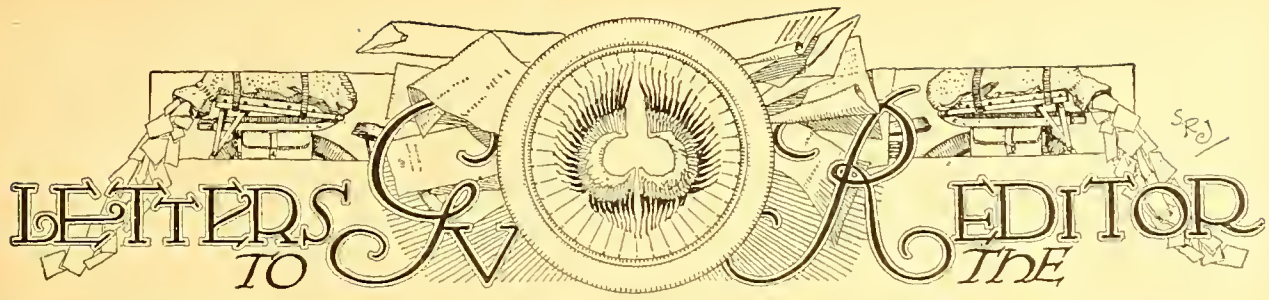
the Philipson pulley form. His variable pulley is made in two halves, pressed together by springs, so that they tend to raise the gear. When extra tension is put on the belt, either by a jockey pulley or other means, the belt pressure overcomes the springs, and the pulley opens. For choice, he mounts his pulley on an arm which swings about the crankshaft centre in order to put extra tension on the belt; the primary drive may then be by chain or gear. The pulley flanges are driven by toothed collars. On a motor cycle there is no room for such a pulley to be swung below the crank case, and if it swung on the upper side of the crankshaft, the rider would surely have to be a dwarf or *very* bow-legged.

Another Method.

Messrs. Hirst complete a trio of variable pulley drives, and I plead guilty to preferring their version. A pinion on the engine-shaft drives an internally-toothed wheel fitted in the centre of the variable pulley. The assembly, consisting of the internal gear wheel and the pulley, is not only eccentric to the crankshaft, but is movable to adjust the belt tension. A substantial gear reduction is obtainable on the primary drive, so that the bottom gear may be low, and is not condemned to the usual lilliputian area of belt contact. I much doubt whether there is room for any more variable pulley gears on the market. Present tendencies are all in favour of the chain with arbitrary



T. E. C. Hirst and L. N. Hirst, variable gear. No. 137,658. 25/2/19.



ratios, and the alternative is pretty fully represented by the Rudge Multi and Zenith-Gradua.

Duplex Frame Construction.

The duplex frame illustrated herewith is protected by Mr. R. B. Coleman, of Sydney, Australia. I fear that its weight and cost of manufacture are prohibitive, quite apart from any technical aspects. The sketch does not show the revolutionary design of the front fork, which includes two inner members of flat section, designed to spring in a fore and aft direction, and provided with spear heads rocking in slots at their upper ends.

Coleman's frame construction. No. 13,623.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

IS IT PROFITEERING?

Sir,—May I draw your attention and that of your readers to the perfectly astounding prices which most firms intend to charge for the new licence card holders. In some cases, as much as 7s. 6d. and 8s. 6d. is being charged. This seems a very clear case of profiteering. True, some are to be of brass, and some nickel-plated, but I fancy that even so the price is most excessive. The cheapest I have seen advertised so far is 2s. 6d. This is rather more moderate; but, even in this case, I venture to consider the price too high. It is not fair of the manufacturers to take advantage of the fact that motor cyclists will be bound to buy these holders by sticking on the price in this way. As a matter of fact, I do not think the highest priced holders will sell very well.

Whitchurch. ANTI-PROFITEER.

[We are inclined to think that owners of luxurious and high-priced machines will be more than anxious to obtain fitments of a comparatively high quality and finish. It is doubtful if a serviceable holder complying with official requirements could be produced at less than 2s. 6d.—ED.]

A TALL ORDER.

Sir,—With reference to the letter by "G.P." in your issue of December 16th, I think that the best thing to do would be to stop motor cycling and buy a car.

However, the nearest approach to "G.P.'s" requirements is, in my opinion, the Velocette fitted with the M-L Maglita lighting and ignition set as shown in the Show Number of your journal.

Being the proud possessor of a two-speed Velocette I am in a position to know some of its merits. Although only fitted with 24in. wheels, this cycle is very comfortable to ride, and a fair sized person does not look out of place on it.

My Velocette has flooded with oil only once during the six months I have had it.

It will climb any hill. On a recent tour in Wales, only twice had I to drop into low gear. With regard to tyres, any pneumatic tyre is liable to be punctured. J.S.J.

Sheffield.

Sir,—As a regular reader of your paper, I should like to advocate a balloon for "G.P.," Sheffield, as it would fulfil most of his requirements, *i.e.*, size according to weight of passenger. It can be ridden in all weathers in ordinary clothes. It can be used at any time, day and night, if tied up in the back yard. No flooding with oil, climbs anything, and will give a year's silent running without attention to any mechanical parts, and is free from tyre trouble.

Farnham. S.D.M.

Sir,—I was most interested in letters by "G.P." and "Speed Wobble."

If "G.P." will take a trip to Bournemouth I have no doubt he will find a 'bus to suit him, though I am afraid it will only be a one pony or donkey power. As for climbing *any* hill, I would not say "two strokes" would do it, but four *might* persuade it.

Now for "Speed Wobble." I like to hear of a man getting a move on, and the boy's performance of doing over 60 m.p.h. with his hands in his pockets is very creditable, considering his age (seventeen). Of course, as a man of more mature age, I can look back on similar stunts of my own. I remember once I rode to the newsagent's (some considerable distance) to buy my copy of *The Motor Cycle*, and on the return journey I could not wait till I reached home to read it so I read it in the saddle. I was doing about 95 m.p.h. at the time. I remember "Ixion's" "Comments" were as pithy as usual, but I cannot remember any sign of wobble.

Derby. A.D.

Sir,—I have just read your correspondent's letter under the heading of "A Fairly Tall Order" asking for a machine which will go anywhere, etc.

I would not advise him to look to a motor cycle to provide the means of transport. I suggest he should wait a little longer and carry out the parson's precepts, and eventually a form of locomotion will be provided, free of cost, which will about fill the bill. I also believe a harp will be thrown in with the bargain.

Those, like myself, who once relied upon surface carburetters, coil ignition, shoe lace belts, with the addition of profanity and tears, cannot hope for his good fortune, but we hope for the best.

As said the fox the grapes are very sour. A.E.S.

Manchester.

A.A. SUBSCRIPTIONS—ANOTHER VIEW POINT.

Sir,—I have read with interest the various letters relating to the increase in subscription to the A.A. Up to the present, none of your correspondents touch the point that interests many in this district, and, no doubt, many thousands of similarly situated people throughout the country generally.

I am a working man, the owner of a sidecar outfit which I am able to use solely at week-ends and holidays for about seven months of the year. I have shortly to pay increased tax of £4, and am asked to pay a fee of £1 1s. if I wish to continue my membership of the A.A. When to this is added the increased cost of petrol, garaging, and every other necessity to motor cycling, and the fact that short working hours are general throughout the country—if one is fortunate enough to be employed at all—you will agree it hits me, and others, in the same position very hard indeed.

Myself and many of my friends and acquaintances do not intend to renew our A.A. membership; some cannot afford it, and some of us for the reason that we think the A.A. should have made much more stringent efforts to get the new tax reduced. It is the owners of the working man's car—the sidecar outfit—who feel the effects of this tax the most. Generally we are married, and, therefore, have more expenses to meet than the owner of the solo machine, who is, more often than not, single.

If someone only had the courage to advise the non-payment of this excessive tax until it was reduced, I feel sure there would have been such an emphatic adherence to such a suggestion that the Government would have seen the necessity and fairness of some reduction to the owner of the sidecar outfit. Many of us are, at the present time, forced to store our machines away.

It will be very difficult for some to pay this tax without making a sacrifice. As a friend of mine remarked to me recently, the £4 tax, £1 1s. A.A. subscription, 5s. driving licence, and 2s. per week garaging are, altogether, more than two weeks' wages on the present working hours.

Let the A.A. think it out from that point of view, and it will form some idea of the number of members it is going to lose.

AN UNGRATEFUL MEMBER OF THE A.A.

Coventry.

MECHANICAL OIL PUMPS IN COLD WEATHER.

Sir,—Having been a continual rider of a motor cycle since 1905, I have read with great interest from time to time the correspondence in your paper regarding mechanical lubrication. It seems to me, however, that the main point has been missed in each case. Before any small pump can be induced to deliver a steady stream of oil, surely some means of warming the oil must be devised. As we all know, especially with air-cooled oil, in the winter time it very nearly assumes the form of butter, whereas in the summer it is quite thin. In the case of cars and some motor cycles the sump gets over all difficulties by warming the oil; any pump will then circulate it quite easily.

Last year I took a trip to Marseilles with my 8 h.p. Williamson water-cooled motor cycle and sidecar. Even using water-cooled oil it became so thick that it would not even draw up into the hand pump. Could one expect any small pump to circulate this? It seems to me that before manufacturers need trouble about a pump they should concentrate upon an effective method of warming the oil in the tank, when, I think, it will be found that any of the present pumps will work perfectly. In the case of engines with sumps this is already done. As things are at present, even if the sump manages to circulate the oil, it must go at only half the speed in winter that it does in summer, therefore setting must be altered frequently. DAVID TOD.

IMPROVING DOUGLAS OIL CONSUMPTION FIGURES.

Sir,—As a patron of your excellent paper for some years now I was very much interested in Mr. E. Victor Abel's letter in a recent issue. I also am a 4 h.p. Douglas sidecar merchant, as they say. I purchased back in the summer a renovated W.D. model dated late 1918, which, I should mention, was in really splendid condition; the engine, I should think, having done hardly fifty miles. However, I have had some considerable trouble both as regards the petrol and the oil consumption. For at least two months it was eating up a tankful of the best spirit to about forty miles at the best, though I am a motor cyclist of three years' experience. The consumption of oil was still more extravagant, the sump full lasting about the same number of miles, and the machine in consequence used to come back to dock more like an oil ship. A friendly tip from a brother Douglas rider put this right, and I simply sweated in a blob of solder in the bottom of the oil delivery pipe and rebored it with a smaller hole. About the petrol consumption, perhaps Mr. Abel would kindly tell me how he adjusts the float; by means of a small washer below the split pin? I tried a smaller jet, as I tried benzole, but it did not act, so I had to replace the No. 28 that was in it originally. The carburetter is the Douglas pattern with the small pipe carrying heated air to the jacket, from the front exhaust pipe. CECIL G. EMERY.

ACCUMULATOR LIGHTING FOR SOLO MACHINES.

Sir,—*Apropos* "D.H.D.'s" remarks *re* accumulator lighting for solo machines, I have been using this system for some time now, and find it fulfils my requirements exactly, *i.e.*, about half an hour's use every evening.

On my machine, however, a four volt Halford accumulator is carried in a metal case, slung on the carrier.

In spite of the vibration that concentrates in the tail of an unsprung motor cycle, I have not experienced any trouble whatsoever from spilt acid or from the paste falling off the plates.

The lamps are connected in parallel, and are operated from a single switch mounted on the handle-bars.

Personally, I consider it is quite unnecessary to carry four accumulators, as "D.H.D." proposes to do, when one will answer the purpose. I have my battery recharged once every three weeks.

The total cost of the outfit was £3 5s. I purchased the various parts at several garages and shops, and would be pleased to send a list of them to "D.H.D." if he is interested.

My 'bus is a 1915 3½ h.p. Indian twin. It has been over the Kirkstone, Honister, How Town, etc., in the Lake District, Bwlch-y-Groes (three times), Eunant Pass, Horseshoe Pass, and many more in Wales, all during the last six months. I have never yet konked out on a hill through lack of power.

"We" did over 1,500 in Wales during September and October, and if trial promoters are looking for a choice piece of road I can recommend the bit between Clun and Kerry. I thought I was getting quite an expert at rough riding until I struck this road and got thrown off twice in fifty yards. The ruts are only 18in. deep—no exaggeration. But I am more likely to be believed when I say that timber has been carted on it for the last four years without any attempt to repair it. There is about six miles of low and middle gear work, and then one breathes again.

H. BARTON.

Even when the country-side is mantled with snow, there is a charm in pottering about the by-lanes. Here a solo rider is able to take advantage of the narrow path at the side of a ford, whereas the sidecarist who accompanied him had to take to the water.

REAR SPRINGING.

Sir,—After much correspondence and mysterious non-committances, we have at last arrived at the time when the ingenious system of retaining a constant transmission tension on a spring frame is revealed (the Durston system, described in *The Motor Cycle* of December 16th).

I was greatly disappointed, as I thought we had really got it this time. When the inventor mentioned eccentric motion it gave a very different idea, but it appears that it was only a smoke screen or dust screen in front of our eyes to hide the real thing.

I had formed the opinion from *The Motor Cycle* that we were strongly following car lines, but it appears I was wrong; it is railway lines, as the idea is a compromise between the link of Stephenson's link motion and the bearing of the railway engine wheel.

In my humble opinion, the device would look better if coil springs were used top and bottom of horn plates instead of the quarter-elliptical springs, which I always think look out of place on a motor cycle.

In friendly criticism, I must pass the following remarks:

Where does the simplicity of the knock-out spindle come in if there are half a dozen operations to perform before the wheel can be dropped out?

As the guides cannot be fully covered, owing to the up and down movement of the wheel, what is going to stop the egress of grit, and what would happen if it clogged one of the horn plates? It also appears to me that the mud-guards would have to have excessive clearance for the movement of the wheel. This, with the shape of the guides and brackets, would spoil the outline of the cycle.

Birmingham. UBIQUE.

CAR PRACTICE IN MOTOR CYCLE DESIGN.

Sir,—May I be permitted to disagree with "Criticus" in his recent article on the above subject?

I have always looked after my vehicles—cars and motor cycles—myself, and I have no hesitation whatever in saying that, to guard against wear, the car requires about four times the attention of the cycle.

It is true that if no care is given to either vehicle beyond the filling of the tanks, the four-wheeler will probably run for longer before breaking down, assuming that first-class examples of each type are experimented on.

I would like to join issue with "Criticus" very definitely on the subject of brakes. I deny point blank that any car foot brake gives as little trouble as those fitted to the single-gear Nortons or Rudges, for example. It is a debatable point whether the car brake is even as effective as a really well-designed belt rim brake fitted to a motor cycle.

The long delay in fitting automatic carburetters to motor cycles was by no means due to ignorance of designers of their existence or value. I submit an automatic carburetter is hopelessly out of place on any machine which is not fitted with a kick-starter and variable gears, the reason being that, on a single-geared mount which has to be pushed off, an automatic carburetter will not supply sufficient power from cold to let the rider get away easily.

"Criticus" will excuse me, I hope, if I accuse him of special pleading, when he states that motor cycle handle-bars jolt far more than a car steering wheel, and that, therefore, two levers cannot be accurately worked. The handle-bar may jolt, but the relative position of the hand and the throttle levers is always the same. Except on a car with direct steering (and such cars are few) this is by no means the case.

Actually, I think that ton-m.p.g. is a senseless sort of test for pleasure vehicles, as the heavier the vehicle the better showing it makes. A decent lorry will knock spots off a car in this test.

Re flywheels. While the outside flywheel has many advantages, it is rather sweeping to say of inside flywheels that "mechanically there is everything to be said against their use."

For their size and weight, inside flywheels damp the shock of explosion better owing to their being so near the crank pin.

It is on the vexed question of lubrication that the car is generally most favourably compared to the cycle. Now, with regard to oil economy the car has it all the time. As against that the motor cycle engine is lubricated with oil all the time. After the first hundred miles or so after a fill the car engine is lubricated with slops. Owing to its much greater working heat, I greatly doubt if the motor cycle engine would stand this sort of treatment.

I have in my garage at present two 1920 cars of different type, each with a very complete lubrication system. Each cost over £850. Neither is constantly supplied with good fresh oil, as is a motor cycle. If I want them to be well lubricated at any reasonable expense my only course is to fill their sumps up to less than the half-way levels and drain them every week. This is what I do in actual practice, and even then it is never oil that comes out of the sump. If I had to buy my oil in the ordinary way I could not afford this at all, as the actual consumption is about 250 m.p.g. I have also four motor cycles, all 1920 models. Two of these have sump type oiling. In theory a quart will last either of these machines 300 miles. Actually, I have to drain the sump about every hundred miles, or the machines lose power and overheat. Of these four machines the only ones that show signs of engine wear are the two with the sump and pump oil supply. They have all done about the same mileage.

A well-known car firm states in its book of instruction that about twenty-two greasers require attention (*i.e.*, turning) each day, and that the adjustment of brakes should be tested each day.

Modern motor cycles require a good deal more attention in the garage than they used to ten years ago. This is due to more complicated transmission and gearing, and, in some cases, springing. But it is definitely the case, and owing to their being a much smaller mass of machinery, it must always remain the case that, to keep them in the best condition, motor cycles require far less attention than cars.

Does this mean that motor cycle manufacturers ought to try and embody as many car features as possible in their machines?

With all respect to "Criticus," I hold that they should not. Even at the present day very few car features can be said to be really satisfactory. Why then should an attempt be made to incorporate them on a totally different type of vehicle, where there is very limited room, and where considerations of size and weight rule supreme?

The ignorance of some designers about other people's products is really colossal.

Finally, "Criticus" says, "Car drivers, however cheap the vehicle, keep dry and clean." Seeing that the writer is on the staff of *The Autocar*, it is impossible to accuse him of ignorance. Therefore, the only conclusion I can come to is that he had his tongue very much in his cheek when he wrote that statement. Mark you, he does not use the word "comparatively" to qualify his statement. If he did I should have no quarrel with him.

As he winds up with such a bald declaration of that sort, I beg to oppose it with one equally bald. It is impossible to keep dry or clean in any open car. One's only chance is to sit in the back of a limousine with all windows shut and have a man to drive. PATIENT PETE.

Chapelizod, Co. Dublin.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
'MOTOR CYCLE REMINISCENCES." By "Ixion," of *The Motor Cycle*. An interesting and amusing description of early motor cycling experiences, with many unique illustrations ...	5/-	5/4

BRITISH MOTOR CYCLE RECORDS ON JANUARY 1st, 1921.

(Compiled by A. V. Ebblewhite, Official Timekeeper to R.A.C., A.C.U., and B.M.C.R.C.).

Table of 231 records as they stand to-day. It will be seen that a great change has been made in the figures published in "The Motor Cycle" in April of last year, and that during 1920 successful attacks were made on most of the pre-war records. Only 42 records now exist which were made prior to 1920, a percentage of 18·18 of the total. The oldest record now standing is H. A. Collier's 24 hours in Class E (May 1909).

New Lightweight Sidecar

Specially Designed for Low-powered Machines.

A LIGHTWEIGHT sidecar of attractive form has lately been brought out by the L.A.D. Manufacturing Co., Rustic Walk, Lower Bourne, Farnham, Surrey.

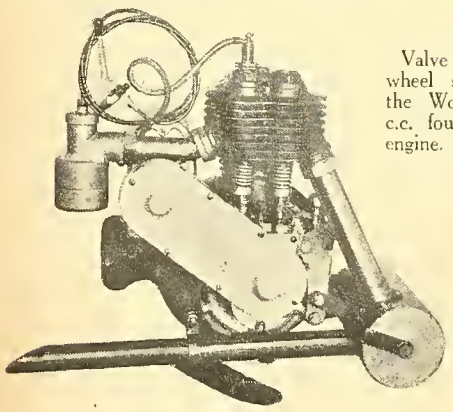
Made throughout in Venesta three-ply wood, the body is varnished before the application of the first of seven coats of paint to prevent eventual cracking or flaking.

The back folds down when not in use, thus keeping the seat dry in the event of rain. It is fastened to the main portion of the body by means of chains, which also allow the angle to be adjusted. The suspension is by coil saddle springs.

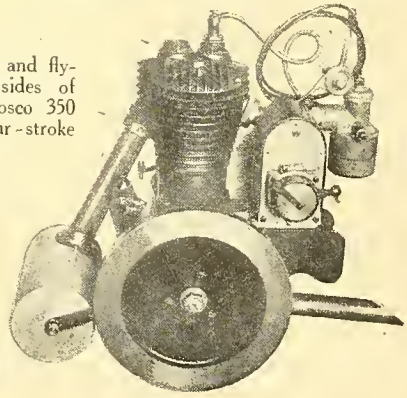
A sidecar for lightweight machines, the L.A.D., which has a hinged back rest, protecting the seat from rain when the sidecar is empty.

Both strong and light, the body is copper-riveted, neither nails nor screws being employed, and it weighs under 38 lb., being especially designed for lightweight machines, such as the 2¾ h.p. Douglas, Levis, and similar makes. This sidecar is also exceedingly moderate in price.

A New 350 c.c. Four-stroke with Outside Flywheel



The Wosco Engine which has a Bore and Stroke of 76 mm.

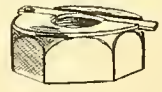


THE outside flywheel continues to gain ground. The latest engine embodying this feature is the Wosco, designed and made by Mr. W. O. Spink, of 52, Broderick Road, Wandsworth Common.

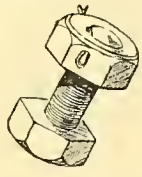
It is a plain straightforward design intended for lightweights, and has a bore and stroke of 76 mm., the capacity being 349 c.c. Side-by-side valves of 1⅝in. diameter are used.

Excepting for the outside flywheel the engine follows well tried practice throughout, but special attention has been paid to lubrication. The oil enters the crank case on the timing side, and is thence conveyed to the cylinder walls and piston by splash from the big end, which dips into a trough cast in the base of the crank case. Cam wheel, rockers, and magneto chain sprocket are lubricated in the usual way by oil vapour from the crank case, whilst both the crankshaft and ball bearings are supplied with lubricant through channels drilled in the casting.

Three rings, located at the top, are fitted to the piston, and an effective method of fixing the gudgeon pin is employed. Two small bolts are screwed into the gudgeon pin bosses, and pass through the gudgeon pin, retaining it in position.



Valve and flywheel sides of the Wosco 350 c.c. four-stroke engine.



MARRYATT MUDSHIELDS.

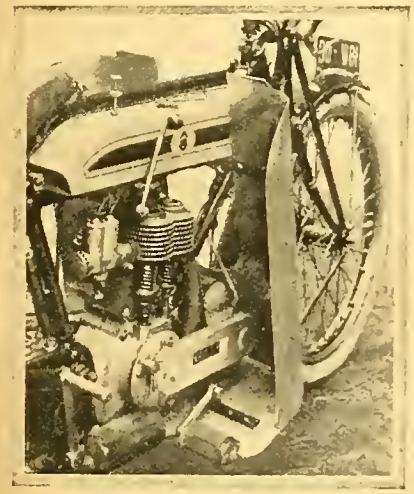
ALTHOUGH front mudguarding has been receiving much attention lately, many riders still prefer a neat, if comparatively inefficient, front guard, coupled, when necessary, with a wide pair of leg guards. Good examples of the latter fitment (illustrated on this page) are made by the Marryatt Engineering Co., Askew Works, Shepherd's Bush, London, W.12.

THE TILSTON LOCK-NUT.

AN exceedingly neat lock-nut is the Tilston, which is secured by being drilled at intervals so as to admit of a split pin being pushed through, and allowed to be engaged with a flat cut on the side of the bolt. The flat on the bolt, in its relative position to the holes in the nut, is always in view, and consequently it is easy to locate the alignment of both; while, in the case of Castle nuts, the hole in the bolt cannot be seen, so the alignment between the slots in the end of the hole and the bolt has to be obtained by feeling with the split pin.

Tilston locking-nut devices.

By using a bolt with two or more flats, a finger adjustment may be made. The manufacturers are the Tilston Engineering Co., Ltd., Albion House, 61, New Oxford Street, London, W.C.1.



Mudshields made by the Marryatt Engineering Co.

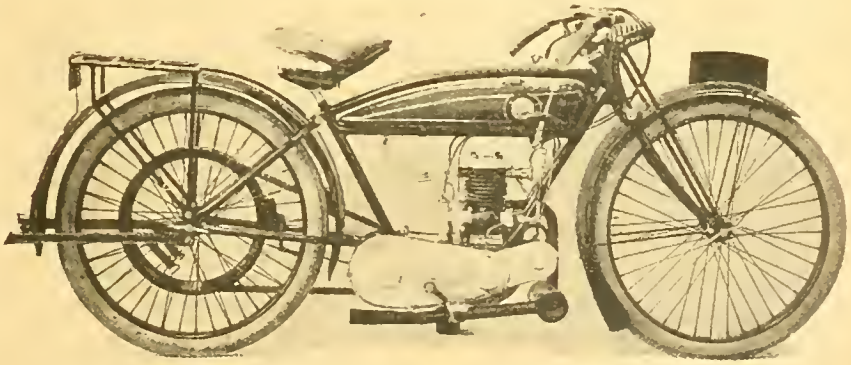
Experiments in Mudguarding.

A One-piece Legshield and Engine Guard for Triumph Machines.

IT is an unfortunate fact that many otherwise excellent machines fall short in the matter of the provision of adequate weatherproofing, such as the "all-the-year-round" type of rider requires.

It is this state of affairs which has called into being innumerable legshields and splashguard devices which are now offered to the motor cycle public. Most of these, it must be admitted, adequately fulfil the purpose for which they are intended, but it sometimes happens that the methods of attachment connected with fittings of this nature leave something to be desired. With this thought in view, Messrs. W. Brandish and Sons, of Foleshill Road, Coventry, set out to produce a complete undershield, magneto-guard and legshields which could be fitted to existing machines with a minimum of trouble.

Simplicity of fitting and ample protection are the great claims made for Brandish's one-piece aluminium mudshield for Triumph machines.



Testing and observing the effectiveness of the Brandish legshields and windscreen in a fifty yards watersplash.

It was believed that to achieve this end in a most satisfactory way only one style suitable for one particular make of machine should be adopted, and the 4 h.p. Triumph was selected. The shield, which is constructed from a single sheet of aluminium, is fitted to the Triumph machine without the addition of any other parts, since the two front tank holding bolts and the two footrest crossbar nuts are used in conjunction with the lugs already attached to the screen; in consequence, the latter may be fitted to the machine in about three minutes without alteration or modification of any part. In order to make quite sure that the rider as well as the engine unit are adequately protected from any splashes thrown off the front wheel, a long series of tests were carried out; and, after a few slight alterations from the original pattern, it was found possible that a long watersplash of quite fifty yards could be negotiated at almost any speed without ill-effects, the rider merely wearing his ordinary clothing and not depending upon waterproof leggings for protection. This should be a great boon to the all-weather "business" rider.

A New French Lightweight.

Knock-out Spindles for Both Wheels and an Aluminium Cylinder Head.

SEVERAL unusual features are incorporated in the 2½ h.p. S.C. two-stroke, made by Etablissements Soyer et Cie., 116, Rue de Paris, Colombes (Seine), France. The engine, which has a detachable head of aluminium and an aluminium piston, has a bore and stroke of 67×70 mm. The carburetter and general appearance conform with English ideas. The wheel spindles are of the knock-out variety, while substantial mudguards are fitted. Needless to say, this machine is equipped with a two-speed gear. The neat aluminium cover for the magneto and transmission chains is worthy of note.

Symmetrical lines distinguish the S.C. two-stroke—a good example of French lightweight design.

,,	12th	... ...	4.43 ,,

Well-timed Greetings.

As usual at this time of the year our mail bags have contained a large number of New Year greetings from readers—one as far off as Newark, U.S.A. and another in New Zealand.

Be Careful.

Motor cycles continue to attract the attention of thieves, a warning to motor cyclists to insure and also to look to the locks of their garages.

The A.C.U. Spring Trial.

We understand that the A.C.U. One Day Trial, which was originally intended to be held in February, has been postponed to April.

Enthusiasts.

They are indeed keen motor cyclists who during the winter will turn to and hose their machines after returning, say, at night, from a muddy journey—yet many do it.

Mudguarding.

It is unfortunate that motor cycles are designed in the summer for the next Olympia Show. If winter conditions prevailed during the experimental period we might see a more decided improvement in mudguarding.

First Aid.

Unable to enter in the London-Exeter run Capt. Dudley Barton, the Dunelt exponent, set himself a useful task to help any competitor in trouble. Loading up his big two-stroke outfit with a plentiful supply of Thermos flasks, he started after the last competitor to find any brother of the wheel in need of a helping hand. He found many who appreciated the mobile restaurant in the wilds of rain-swept Salisbury Plain, and also the assistance he was able to give in a mechanical direction. It was a very sporting action and deserves official recognition.

Frame Design.

The effect of the various stresses communicated to the members of the motor cycle frame was the subject of an interesting paper by Mr. Douglas Leechman, read before the Institution of Automobile Engineers last week. It was pointed out that a frame consisting of a series of triangles should be so interconnected that the load is applied at the apices and not at the sides. The author discussed the extent to which the ordinary design of the frame to-day complies with these requirements, and then drew attention to the necessity for large diameter in the bottom tube to diminish any tendency towards "rolling."

Special Features.

A TWO YEARS' TEST.

BRITISH MOTOR CYCLE RECORDS.

PER ARDUA AD—EXETER.

Economy.

The People's Union for Economy is still going strong, but we have yet to see it advocate the more extended use of motor cycles in lieu of trains or other expensive methods of transportation. Forms of membership to the Union may be obtained from 1, King's Buildings, Millbank, S.W.1.

Taxation.

Many owners of motor cycles seem keen to know the weight of their mounts for taxation purposes. We would remind readers that only in the case of machines near the border line of 200 lb. is it necessary to ascertain the actual weight. Below we give a list of some of the machines which are in the neighbourhood of 200 lb.: Alecto (189 lb.), Allon (190 lb.), Armis (185 lb.), 2¾ h.p. and 4 h.p. Coulson B. (191 to 198 lb.), 2¾ h.p. Douglas (174 to 199 lb.), Edmund (185 to 199 lb.), 2¾ h.p. Excelsior (193 lb.), 2¾ h.p. Francis Barnett (195 lb.), 2¾ h.p. H.B. (199 lb.), Invicta (187 lb.), 3 h.p. Ivy (188 lb.), 2¾ h.p. Massey Arran (196 lb.), 2¾ h.p. New Imperial (186 lb.), 2¾ h.p. Royal Ruby (185 lb.), and 2¾ h.p. Wolf (192 lb.). All the above are low-powered solo machines, except the 4 h.p. Coulson B., which is capable of medium-weight sidecar work.

BESIDE THE DEVONSHIRE COAST IN THE M.C.C. LONDON-EXETER TRIAL.

Near Lyme Regis. A. P. MacGowran (4 Triumph sc.) making an adjustment by the wayside.

TAXATION.

Your new licence, which includes taxation, must be paid before January 31st. After this date a licence, which will include numbers, must be taken out before the machine can be used.

The taxes and liecnces are:

- 5/- for motor-propelled machines for invalids.
- 30/- for a solo motor cycle under 200 lb.
- 50/- for a sidecar outfit, the motor cycle of which is under 200 lb.
- 60/- for a solo motor cycle over 200 lb.
- 80/- for a sidecar outfit, the motor cycle of which is over 200 lb.
- 80/- for a three-wheeled cycle car under 8 cwt.

The weights mentioned are unladen weights, *i.e.*, without petrol, oil, and equipment, which is not actually necessary for the machine to run on the road.

The new licence includes registration and taxation, but does not include the driving licence, which remains as before—5s. per annum.

DO NOT WAIT UNTIL THE 31st OF JANUARY!

Next Thursday

Next week's copy of *The Motor Cycle* will cost you only 4d.

The A.A. Taxation Booklet.

A summary in handy form of the various points arising out of the new taxation scheme has been issued by the A.A. Members may obtain a copy free on application by postcard.

Fuel Prices Down.

Commencing on Monday last there was an all-round reduction in the price of motor fuels; sevenpence being deducted from the gallon of petrol, and threepence from benzole. The sevenpence off the petrol price is, of course, in respect of the late fuel tax (plus cost of collection) which is now abolished. Benzole has always been free from tax, therefore the new price represents a genuine reduction. The new prices announced by the Shell Marketing Co., Ltd., this week are: Aviation, 3s. 9½d. per gallon; No. 1, 3s. 5½d. per gallon; Mex spirit is 3s. 3½d. per gallon, while benzole is to be 3s. 8d.

"Motor Traction" becomes "Motor Transport."

The changes of expressions and meanings of words have had many strange results in our dictionaries. The war brought about many such, but there is one that has not been generally realised. It is the word "Transport." Prior to the war, if the word were used, it generally implied a ship that carried troops; to-day it covers everything that carries anything. Likewise, another word has changed—"Traction." This singular verbal revolt has given the staff of our sister journal, *Motor Traction* "for to think." So that no misconstruction should be read into the title it has been changed, and in future will be known as *Motor Transport*. In no wise will the style of the paper be altered, and it will continue to keep its readers fully cognisant of the doings in the transport world as in the past.

Open Events in the North.

At a meeting of the Motor Cycle Board of the North-eastern Automobile Association held at Newcastle, when Mr. T. A. Nicol, O.B.E., presided, it was determined that control of an open reliability trial granted to the Board by the Auto Cycle Union for 30th April next, and an open hill-climb for 30th July next, should be handed over to the Newcastle and District Club. The Board also provisionally accepted a third open event for 24th September next, and secretaries of affiliated clubs at South Shields, Tynemouth, Sunderland, Durham, Hartlepool, Stockton, Bishop Auckland, Darlington, and Wansbeck are to be asked if they have any ambition to run the event.

Exeter Finishers.

In tabular form below is a general analysis of the entries, starters, and finishers in the various classes which ran in the M.C.C. London-Exeter return run. It will be noticed that the best general performance was made by the three-wheelers, while the proportion of solo riders who got through the trying journey is distinctly creditable.

Class.	Entries.	Starters.	Finishers.
Solo	80	69	40
Sidecar	80	70	47
Three-wheelers ..	13	13	12
Cars	64	54	46
Totals	237	206	151

A Guide to the New Licences.

Much useful information concerning the licensing, registration, and taxation of motor cycles is contained in a shilling guide just published by the Auto Cycle Union. The motor cyclist is told how to apply for a licence, where to display his licence card, particulars as to the renewal and transfer of licences, issue of duplicate licences, registration, the registration book, and is given much other useful information.

The book concludes with a list of registration and licensing authorities in the United Kingdom, a list of lightweight motor cycles giving the weight of each, and a table indicating the increase or decrease of the amount of annual tax payable by a motor cyclist in the year 1921, as compared with previous years.

Front and rear views of the new A.C.U. combined badge and licence card holder.

THE MOTOR CYCLE

4d.

As announced last week, commencing with next Thursday's issue, the price of "The Motor Cycle" will be 4d. instead of 4½d. as hitherto.

A small reduction in the cost of paper enables us to effect this slight change. We regret we are unable at present to lower the price to 3d., but the vast circulation (over 100,000 net) makes this impossible at the present cost of labour and material.

A further reduction in price will be made as soon as circumstances allow.

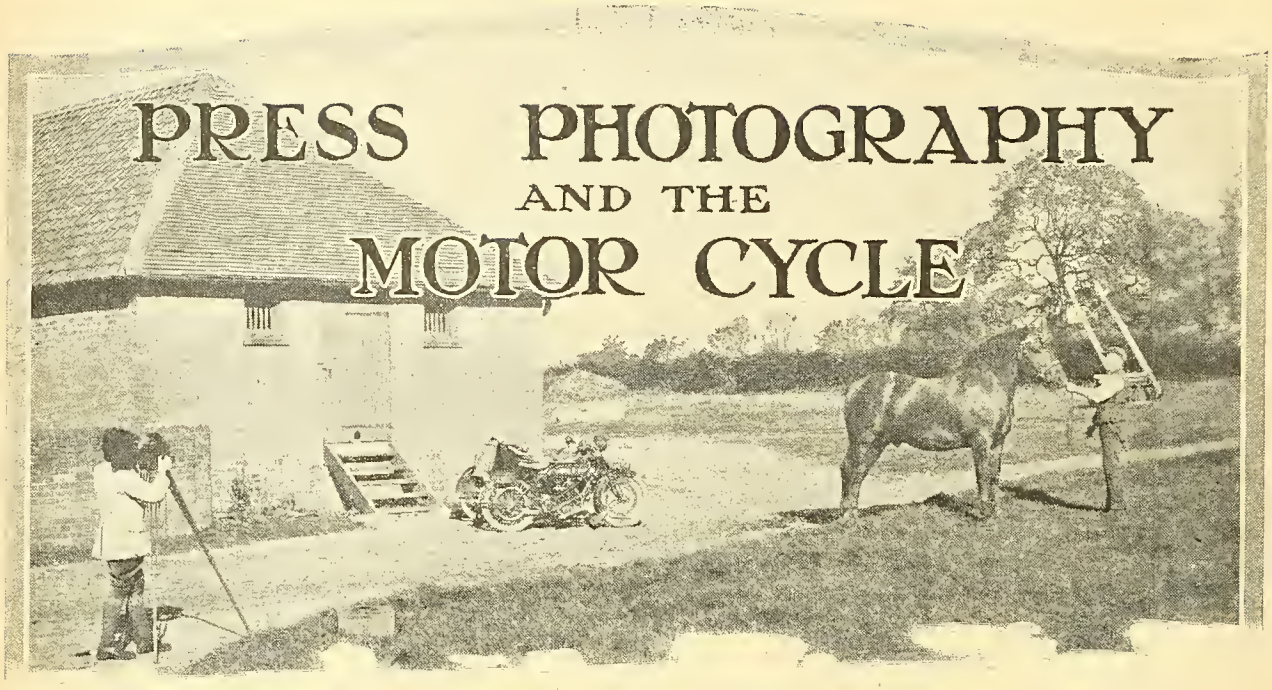
ILIFFE & SONS LTD.

Cautious Garage Men.

Careful garage proprietors last week were apparently clearing out their 1920 stocks of petrol, and often in consequence only Aviation or some of the heavier grades of spirit were available. That, anyhow, was an explanation we listened to on several occasions; and we need hardly add that bargain sale tactics were *not* adopted.

"The Autocar"—4d.

Our parent journal, *The Autocar*, the representative British motoring journal embracing all types of cars, will from next week's issue be fourpence per copy instead of sixpence as at present.



Another Licence Holder Idea.

Ingenuity in providing means of fixing the new licence carriers has by no means exhausted itself. Although primarily designed for car use, a neat device which could be applied to most sidecar bodies was described in a recent issue of *The Autocar*. The holder is simply attached to a sheet of flexible material (sheet rubber), stiffened by a wire frame, and the top portion of the latter is bent over so that it may hang over the top heading of the door. It is secured inside beneath the upholstery of the interior, and its advantages are that it is not dependent on close fitting to contoured body panels, nor is the surface of the latter damaged in any way.

An A.C.U. Licence Card Holder.

Members of the A.C.U. will be able to parade their licence on the same clip that will carry their badge. Realising that the average motor cyclist has an aversion to having too many clips on his handle-bar, the A.C.U. has introduced a combined badge and licence card holder, which is exceptionally neat, and has no small bolts and nuts to hinder cleaning. The illustrations show the construction and general appearance of the new badge and holder, which is to be offered to members for 5s.

PRESS PHOTOGRAPHY AND THE MOTOR CYCLE

The Advantages of a Sidecar for Press Work in Out-of-the-way Places. A B.S.A. Outfit in the Hands of the "Agricultural Gazette" Photographer.

ONLY pedlars and *The Motor Cycle* photographers are required to go to such out-of-the-way places as myself. I travel over large areas of this country in quest of pedigree animals to obtain photographs for the *Agricultural Gazette*.

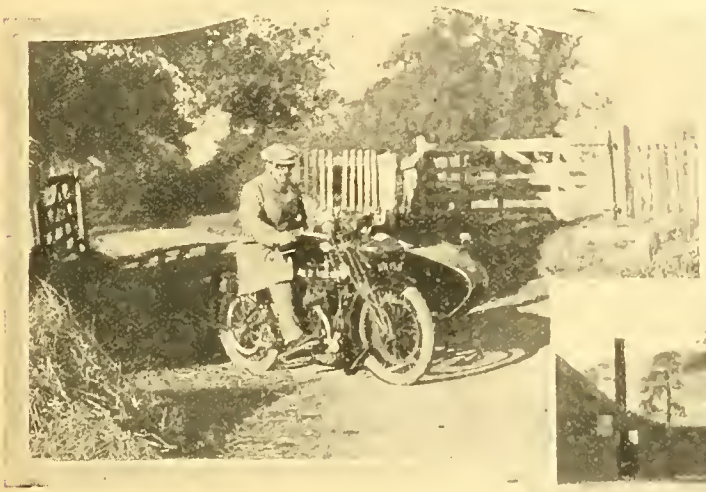
In the early days I found considerable difficulty and delay in reaching a destination for the reason that my "hunting grounds" were remote from railway stations, which often are of so unimportant a character that the chance of securing a conveyance was very doubtful.

As my trips were often of a fortnight's duration, it was necessary to take with me a large supply of photographic plates, as I frequently make several hundred exposures on one outing. This plate item, in addition to my camera outfit, rendered my "kit" a distinctively heavy one, making a walk of even a mile or so practically impossible.

The accompanying illustrations indicate the way in which I finally solved the problem, with a 4¼ h.p. B.S.A. and its well-sprung sidecar, which carries the "kit" without vibration. Vibration, leading to friction and chafing between the sensitive plates, was my greatest fear, since the slightest rubbing of these delicate surfaces would be quite sufficient to damage an otherwise good animal portrait. The mechanism of the special animal camera, too, would possibly be endangered by undue jolting.

The local inn frequently has to provide "lunch," which often consists of humble bread and cheese.

I found that, by taking out the cushioned seat, I could accommodate a good size leather "kit bag," and by means of two ropes I fastened this to the base of the sidecar. Into this bag went my camera case,



Press Photography and the Motor Cycle.—

and round the latter I packed my spare plates with small cushions of hay to keep the whole of the apparatus tight. When the bag was closed, the contents were insulated from such road shocks as the springs did not take up when traversing rutty lanes and farm tracks. My personal equipment is carried in the fore part of the sidecar, and, if need be, a few more boxes of spare plates also.

Since March of this year I have covered close upon 7,000 miles without more than merely trivial attention to the machine, and with only some half a dozen cases of "friction" marks on the plates. The ease with which I can get to my destination, whether it be a few miles across country or three hundred miles away, is surprising, and such journeys (unless caught in very bad weather) are a source of real pleasure and enjoyment. At the end of my journey I am fresh and ready for work, instead of fatigued by carrying my heavy camera outfit from one stuffy train to another.

Frequently in the rail-travelling days, when my photographic work was done, I had to wait three or four hours for the first available train. By motor cycle, I pack up and am on the road to my next appointment within half an hour of making my last exposure. The sound, if rather heavy, construction of the B.S.A. machine, is exactly the thing for my comparatively rough all-weather requirements, and nothing could be better than the way it has answered my needs with the minimum of attention and experience.

THE SIDECAR TAX.

A Point in the New Taxation Scheme which should be Altered.

IS the £1 sidecar tax an impost on the attachment, or a tax on the right to use a sidecar?

This question has been raised by more than one reader, and it reveals a point which should be amended. As it stands at present, a motor cyclist may pay the tax several times per year on the same sidecar, and we are sure this was not intended. The £1 extra tax for a sidecar over the motor cycle tax merely gives the right to attach a sidecar, and is not a tax on the attachment itself.

An Extreme Illustration.

As an extreme example to illustrate the point, we will suppose that a rider buys and sells his solo motor cycle several times during the year, but retains the sidecar which he uses with it. Each of the new machines would be subject to the full sidecar tax, and the buyer would take, with a machine without an attachment, the taxation registration giving him the right to attach a sidecar. It may happen that the purchaser may not want to use the machine with a sidecar, but if the seller has added the tax to the price of the machine, he pays for the right, and perhaps the next year some confusion may arise with the authorities when it comes to renewing the licence.

Far better would it be for the sidecar tax to be complete in itself—although it would call for a separate licence card and holder.

Probably the three most outstanding features of post-war motor cycles are disc wheels, sidecar screens, and pillion seats. The popularity of the wheel disc continues to increase and is likely to do, since the present day product is a vastly superior article to the first efforts to enclose the spokes. Sidecar screens are now regarded as absolute essentials by 90% of motor cyclists—even the smallest sporting sidecar has its miniature screen. While as for pillion seats—every other machine one sees on the road is equipped for the occasional extra passenger.

C

CLUB NEWS. (Continued from page 12.)

Birmingham M.C.C.

The annual dinner, smoking concert, and prize distribution will be held on Friday, January 21st, at the Imperial Hotel, Temple Street.

Liverpool M.C.

A two-day winter reliability run to Edinburgh and back will commence on January 22nd. There will be no secret checks, and failure to climb Kirkstone Pass will not entail disqualification.

On Friday, January 28th, the annual general meeting of the club will be held at the Compton Hotel, Church Street, Liverpool, at 7.30 p.m.

Carmarthen and District M.C. and C.C.C.

The second annual dinner in connection with the Carmarthen and District Motor Cycle and Cycle Car Club was recently held at the Nelson Hotel, Carmarthen, Mr. W. D. O. Thomas presiding.

Mr. William Edwards, Carmarthen, in proposing "The Sport," said they had met in many keen competitions last year, and he trusted he would meet them again next season.

Dr. A. Lindsey, Ystalyfera, in responding, said opinions differed as to sport. *Punch* defined it as a sport which was merely sitting in a draught. (Laughter.) He was very keen on it from an educational point of view.

The toast of "The Carmarthen Club" was submitted by Mr. D. J. Powell, who said they had had the honour of organising an open speed trial. They intended instituting a Welsh T.T. at Pendine in 1921.

Cumberland County M.C.C.

This club has had a most successful year. The membership has increased considerably, all events have been well attended, and the financial position is most satisfactory. The open event (the first allocated to this club) was a decided success. An annual general meeting is fixed for the 21st January, and the annual dinner for the 28th.

North Wilts M.C. and L.C.C.

Over seventy members and friends attended the first annual dinner of the North Wilts Motor Cycle and Light Car Club, held at the King's Arms Hotel, Swindon, under the chairmanship of the president, Mr. E. C. Skurray, M.B.E. During the evening the president distributed the cups and medals won by members in the club competitions, including silver cups presented by Messrs. English, Salvage, Skurray, and an anonymous donor, and a gold medal presented by Messrs. Triumph Cycle Co., Ltd.

Reigate and Redhill M.C.C.

A preliminary meeting was held at the Warwick Hotel, Redhill, recently, there being a large attendance of motor cyclists, including several ladies. The meeting decided that the name of the club should be the Reigate and Redhill Motor Cycling Club, and, also, that the club be affiliated to the A.C.U., the annual subscription to be 10s. 6d. with an entry fee of 1s. The annual general meeting is fixed for January 6th at the Warwick Hotel, Redhill. Mr. E. P. Duplock, 15, High Street, Redhill, will furnish any information required.

Bristol M.C.C.

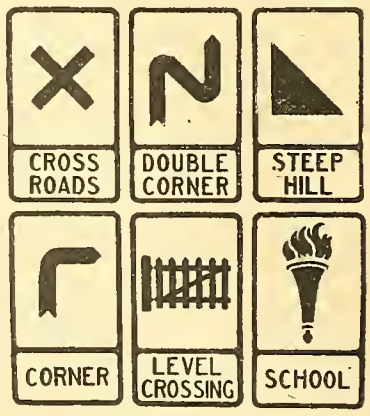
On Boxing Day the riding conditions in the West were so uninviting that only eleven of the twenty-three entrants followed the trail laid by Messrs. A. E. Tozer (Rudge sc.) and W. Scampton (Matchless sc.). Not a stiff course in good weather, yet it proved one of the muddiest. It included several good climbs, plenty of water-logged roads, and was as strenuous as anyone could wish.

Edinburgh and District M.C.C.

At the club dinner held in the Caledonian Station Hotel, Princes Street, Edinburgh, Colonel Slater occupied the chair. Representatives from Glasgow clubs included Mr. Simpson, President of the Glasgow Western M.C.C., and several others. Mr. Anderson represented the Cumberland County, and Mr. J. M. Russell the Peebles and Tweed Valley M.C.C. The Chairman asked Mr. Anderson, of the Cumberland Club, to toast Edinburgh and District, which Mr. Anderson did with becoming grace, apologising for the absence of Mr. J. J. Dias, the well-known P. and M. rider, and extending a welcome to the Edinburgh Club members to participate in Cumberland events. The programme was filled in with the usual speeches and songs, Messrs. Muirhead, McKay, and Downie contributing to the musical programme, while Messrs. Campbell McGregor, H. Alexander, J. Alexander, and Mr. Simpson, of Glasgow M.C.C., all made excellent speeches.

MOTOR CYCLE DISPLAY IN SCOTLAND.

ALTHOUGH the Olympia Shows are visited by a large number of buyers in Scotland, it is only to be expected that this number by no means includes all Scotch motor cyclists and car owners who desire to examine new models. That this is duly appreciated in the automobile world is apparent, since a Scottish show is always arranged about this time of the year, but unfortunately prospective buyers of motor cycles have not the same opportunity to inspect the latest machines.



This year, however, an effort is to be made to meet this need, and during the Scottish Automobile Show at Glasgow, January 28th to February 5th, motor cycle agents in the Scottish Metropolis propose to make a special display of 1921 machines, which should be a great convenience to those of our readers who reside north of the border. While this idea cannot be so fruitful as an exhibition, there is every promise that the results will justify the effort. We understand that the display is intended to interest all private buyers and agents in Scotland, and not, as might first be supposed, a selfish attempt on the part of Glasgow traders to attract buyers outside their territories for their own ends.

UNIFORM DANGER AND DIRECTION SIGNS.

A SCHEME for obtaining uniformity in road direction posts and danger signs has been under consideration by the Ministry of Transport for some months, and its recommendations have now been made public.

Regarding the first item, roads are to be numbered and classified, as in some Continental countries, as first or second-class routes. Standard direction posts will be used, a first-class road being indicated by a black letter A and the route number on a white ground, and a second-class road by a white letter B and the route number on a black ground.

On this page also are shown the proposed new types of danger sign, but it must be understood that these are to be used in conjunction with, and not to supersede the familiar red triangle. The special danger to be guarded against will be indicated by its respective symbol on a plate 12in. wide by 21in. high, to be attached to the post below the triangular danger sign. It should be noted that special signs will not be erected at cross roads or junctions that are in visible positions nor at the approaches to towns and villages. Contrary to general expectations, nothing is embodied in the recommendations regarding a prior right-of-way for the main road rider and vesting the onus of special caution at cross roads on the driver emerging from the secondary road. This is disappointing.

Signs indicating specific dangers.

THE FINE ART OF PUBLICITY.

No one may accuse the Worcester M.C.C. of not being enterprising. Several members of the club assisted at the M.C.C. London-Exeter Trial; and at the supper stop at Salisbury each competitor was handed an envelope containing a propaganda summary of the why and wherefore of the "Sporting Club."

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not must be accompanied by a 2d. stamped addressed envelope for reply. Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

SOLID TYRES WANTED.

I believe in a previous number of *The Motor Cycle* I saw reference to solid or semi-solid tyres. Will you please be good enough to inform me who are the makers and retailers of these tyres? Do you consider that the modern sidecar outfit would stand the fitting of these, provided they were used for ordinary family use?—L.J.G.

Solid tyres would not be suitable for existing types of motor cycles, and, so far as we know, they are not manufactured.

BELT WEAR.

I ride a 6 h.p. Zenith outfit, and had a new belt not long ago, and have done 500 miles with it. As far as I know it is now useless, the rubber being stripped from either side although otherwise quite sound. Can I get it re-covered with rubber in the same way as a cover is retreaded?—BRIGHTON.

The belt should not be worn out in such a short distance, and we can only think that the trouble has arisen through faulty methods of driving. The Gradua gear should not be operated violently, but the change in ratio should be made by gradually moving the handle to right or left as desired. One of the surest ways of spoiling a belt is rapidly to lower the gear from top to bottom. We have never heard of belts being re-covered with rubber. The expense of dealing with small lengths would be prohibitive.

RIGHT OF ENDORSING LICENCE.

While travelling along the Cambridge Road I ran into a police trap just outside a village. The speed given was twenty-seven miles per hour, and for this I was dealt out the maximum fine of £3 and licence endorsed. As this is my first offence in twelve years' driving, apparently a good deal rests on the type of magistrate one encounters, for a friend of mine was only fined 10s. 6d. for a similar offence in London, and this not his first appearance. Should my licence have been endorsed?—A.F.J.

The fine certainly appears to be harsh, especially if the speed limit was exceeded on a safe stretch of road. However, the magistrate has the right to exercise his discretion in the case. It is understood that a licence cannot be endorsed for the first or second offence of exceeding the speed limit, and possibly you might get the endorsement cancelled if you take up the matter with the Clerk of the Court concerned.

THINNING A THICK OIL.

I should be much obliged if you would give me advice on the following. Having a quantity of B.B. oil and a motor cycle fitted with a 2½ h.p. Villiers two-stroke engine, I wondered if this oil would do thinned down with petrol.—A.A.S.

It would be inadvisable to thin down thick lubricating oil with petrol. A far better course would be to obtain some Vacuum A and mix until the oil is as required, although, unless the weather is exceptionally cold, there is no reason why you should not use the heavier grade.

STROKE-BORE RATIO OF TWO-STROKES.

(1.) On a two-stroke engine is there any advantage as regards speed in using roller bearings for the big end of the connecting rod? What is the difference approximately? (2.) Would an engine with a shorter stroke than bore give off higher speed than one of equal bore and stroke (type of engine, two-stroke, three-port)? (3.) What power should a two-stroke, three-cylinder engine, 2⅜in. bore by 2½in. stroke, give? Am I right in assuming about 7½ h.p.?—H.A.B.

(1.) Roller bearings are quite satisfactory for the bigs ends of connecting rods on a two-stroke engine, and have the advantage of withstanding hard work under adverse conditions. (2.) Usually a two-stroke engine has a "square" cylinder, but there are several on the market, both for motor cycle and motor boat work, which vary in both directions. It depends entirely upon the port design, but generally it is considered that the short stroke is the better. (3.) Seven and a half horse-power should be attained with three cylinders of the size you state.

ADDITIONAL BRAKE.

I should be pleased for your advice on the following. I have an old model 7-9 h.p. Indian. This has had a pedal starter, with Corbin Brown coaster brake (duplex acting). The starter pedals are scrapped, and only the external contracting band brake will operate. All the internal parts are perfect; but I do not know how to adjust, for although the bronze disc is interconnected with the foot pedal, it fails to grip, owing, apparently, to movement in the starter sprocket on the opposite side of hub. (1). How should I adjust this without getting separate starting equipment? (2.) What would be the best form of secondary brake—front rim, dummy belt rim, or some make of external contracting brake?—S.H.R.

(1.) Your machine must be a very old model, and we have no available information regarding the American type of coaster brake which you describe. (2.) You cannot fit a front rim brake on account of the action of the Indian front forks, and probably the easiest way out of your difficulty would be to fit a dummy belt rim on the back wheel. Complete rear brakes may be obtained from several accessory firms.

In our New Year's Post Bag: Greetings from the Ariel Competition Riders—L. Newey, J. L. Stocks, and T. Peck.

REMOVING A TRANSFER.

A dealer's transfer has been put on my new machine in disregard of my strict orders to the contrary. As it spoils the appearance I wish to remove it. How can I do this without injuring the enamel?—TASTY RIDER.

If you proceed carefully you may remove the transfer by means of a flannel soaked in turpentine. The cautious application of benzole might also help matters.

A BELT THAT TWISTS.

I have recently bought a 6 h.p. 1914 belt-driven machine with sidecar, and am having some trouble with the belt (1¼in.) twisting and running on its side on the back wheel pulley only every four or five miles. Please tell me the cause and the remedy.—W.M.H.

The trouble may be due to the belt being of the incorrect angle and being hardly deep enough. Also, in all probability the pulleys are for 1in. belts only.

IS IT A PISTON TAP?

I should be much obliged if you would help me to elucidate the origin of a metallic knock, or clanking, which has made it impossible for me to ride a W.D. Triumph I obtained from the War Motors Association last February. I have made the following repairs in order to try to prevent the noise, viz.: (1.) Fitted new roller bearings to big end. (2.) Taken flywheels apart and reset. (3.) Fitted new small end bearing carefully. (4.) Turned out grooves in the piston and fitted wider rings neatly. (5.) Decarbonised, ground in valves, etc. (6.) Dismantled, took to pieces, and cleaned out Sturmey-Archer three-speed gear box. (This was in perfect order.) (7.) Dismantled clutch entirely, and found it in good order. (8.) Raised cylinder ¼in. In spite of all the above alterations, the knock is as bad as it was in the beginning. The valve tappets are loose in their guides, but the timing gear is in excellent condition. When riding I have held up the valve tappets against the valve stems tightly with my fingers, but without producing any diminution of the distinct clanking. Testing on the stand, using a wooden shaft as telephone, indicates that the noise comes from the cylinder. On taking out the plug and revolving the engine by means of the kick-starter the noise was very audible. The only thing that I have not done so far is to replace the tappets and guides. Do you think that this can be the cause? My cylinder is perfect, the rings are bright, and compression very good.—B.R.B.

You have apparently carried out all the adjustments which would remove the cause of the trouble, and we can only think that the noise is due to the piston being a very loose fit in the cylinder. If by any chance the worn part of the cylinder bore is distinctly larger than the mouth of the cylinder it is quite likely that you will get a knock, due to the bottom piston ring striking the edge of the unworn part, since you have raised the cylinder ¼in. You might examine the inside of the bore carefully, and see if wear is discernible.

LIGHT FROM MAGNETO.

Is it possible to use an ordinary high-tension magneto for lighting? and what alterations would have to be made in the winding of the armature?—F.C.

You can obtain a light from the high-tension magneto by using the surplus low-tension current, which may be tapped off from the cut-out switch and passed to the lamps through a choking coil.

Important Dates.

Jan. 20th—
F.I.C.M. Conference, Brussels

Jan. 28th to Feb. 5th—
Scottish Motor Exhibition, Kelvin Hall, Glasgow.

Feb. 25th—
A.C.U. Silencer Trial—Brooklands.

March 25th—
Richmond Meet.

March 26th—
M.C.C. London-Land's End Trial.

April 27th—
A.C.U. One-day Winter Trial for Stock Machines.

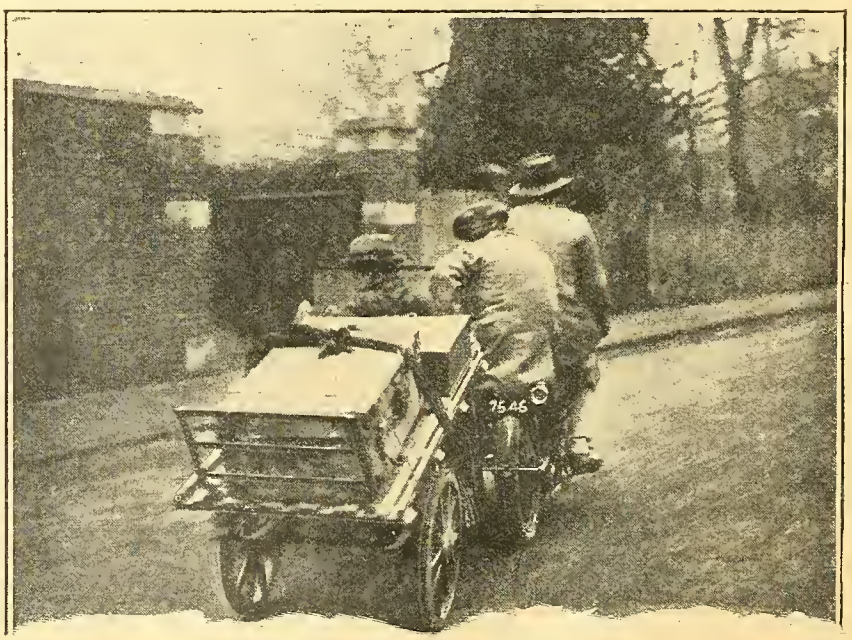
May 14th—
M.C.C. London-Edinburgh Run.

WHAT IS A "CUT-OUT"?

(1.) What is the law regarding the silencing of motor cycles? (2.) What is a "cut-out"? (3.) Is a perforated silencer a "cut-out"?—H.W.

(1.) The law on the silencing of motor cycles is not very clear. The exhaust gases must not pass directly from the engine into the atmosphere without first passing through a suitable silencing device. Provided a machine is reasonably silent, the construction of the silencing arrangement is more or less left open to the designer. (2.) A "cut-out" is an apparatus which allows the exhaust gases to pass directly to the atmosphere without first passing through the silencer. (3.) A perforated silencer would probably be regarded as a "cut-out," especially if the machine was noisy.

EXTRA AIR INLET.



I have a 1919 3½ h.p. Rudge-Multi with Senspray carburetter, and at present obtain 60-65 m.p.g. (1.) Is this a fair average? (2.) I am told that the fixing of an extra air device in the induction pipe would give (a) more speed, (b) more power, and (c) greater m.p.g. Is this so? (3.) Are there any disadvantages to be set against the advantages mentioned in (2)?—C.G.

(1.) Much depends on the nature of your riding, but, solo, your consumption should work out at about 80 m.p.g. Verify jet size, petrol level, and ignition timing with the makers' instruction booklet. (2.) As the Senspray is a two-lever carburetter, we question if an extra air inlet would give the greatly improved efficiency which your friend predicts. (3.) Provided the extra air inlet is correctly fitted so as to avoid air leaks, there is no objection to such extra fitments except the initial expense.

RECOMMENDED ROUTE.

CLEETHORPES TO MILFORD HAVEN.—J.W.G.

Cleethorpes, Humberston, Tetney, Fulstow, Covenham, Louth, Horncastle, Tattersall, Sleaford, Falkingham, Bourn, Stamford, Uppingham, Rockingham, Market Harborough, Rugby, Warwick, Alcester, Worcester, Hereford, Willersley, Hay, Brecon, Llandovery, Llandilo, Carmarthen, St. Clears, Narberth, Haverfordwest, Milford Haven. Approximately 310 miles.

EVERY MAN HIS OWN PORTER.

Eton boys who, in their eagerness to catch the first available train at the Christmas holidays, utilised a Triumph sidecar to convey their luggage to the station.

There are Plenty of them

Over 26,000 "Eastings" have been sold, and every one has a thoroughly satisfied owner.
The new 1921 "Easting" incorporates all the perfections of its predecessor, but is more adaptable and far easier to manipulate.
We have plenty of them—in any shade to match your sidecar.
An "Easting" makes every ride ten times happier for your passenger—she is really comfortable and protected in any weather.
Get a new "Easting" now for her sake—or write for the "Easting" booklet.

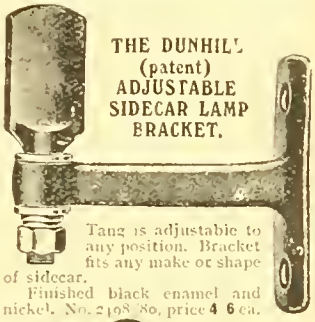
EVERYTHING for the MOTOR CYCLIST.

ALL WOOL MITTS

2/- per pair. Postage 2½d. extra.



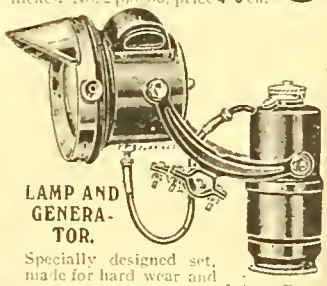
Beautifully warm. For wear either alone or under ordinary gloves. All wool.

Secure a pair of these all wool mitts *to-day* without fail. The offer cannot be repeated. At this very low price these mitts represent exceedingly good value, and a pair should be obtained by every motor cyclist.

Special Line
BALACLAVA HELMETS
All wool. Splendidly cosy and warm. Completely cover the ears and throat. Price 2/- each. Postage 3d. extra. Write for one to-day.

POST ORDERS.
Every attention is given to orders sent through the post and complete satisfaction is ensured. Simply mark a X against the item wanted, write your name and address on the margin of this page, tear it out, pin on your cheque postal order or money order, and post to us.

THE DUNHILL (patent) ADJUSTABLE SIDECAR LAMP BRACKET.

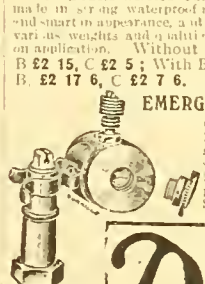


Tang is adjustable to any position. Bracket fits any make or shape of sidecar.
Finished black enamel and nickel. No. 2408 So, price 4/6 ea.

SIDECAR LAMP.
Torpedo shape model for acetylene in polished aluminium, with side bracket fixing. Very light, yet extremely strong. No. 22130 So, price 12/6 each.

REAR LAMP
A very smart little lamp. Torpedo shape in aluminium. No. 2135 So. With carrier fixing 7/9 each. No. 2137 So. With number plate fixing 7/9 each.

LAMP AND GENERATOR.
Specially designed set, made for hard wear and long service. Handle-bar fixing. Best quality. British made throughout.
An exceptionally efficient, compact, durable and neat outfit.
No. 2405/80, price 60/- per set complete.



WATCH IN CASE
for fitting on handle-bars. Round pattern. Black or nickel finish. 30 hour movement, 18/9
Superior quality, 30 hour, 35/6

WATERPROOF JACKETS.
2415/60 Double-breasted Jacket, 44in. long, made in strong waterproof material, well-cut and smart in appearance, and very durable, in various weights and qualities. Patterns sent on application. Without Belt, A £3 3, B £2 15, C £2 5; With Belt, A £3 5 6, B £2 17 6, C £2 7 6.

EMERGENCY LIGHT.
Gives a serviceable light, ample to enable you to complete your journey in safety should any mishap occur to the regular acetylene supply. Simply fill the reservoir with petrol and clip on to the lamp burner as shown. Strongly made in brass and nearly finished

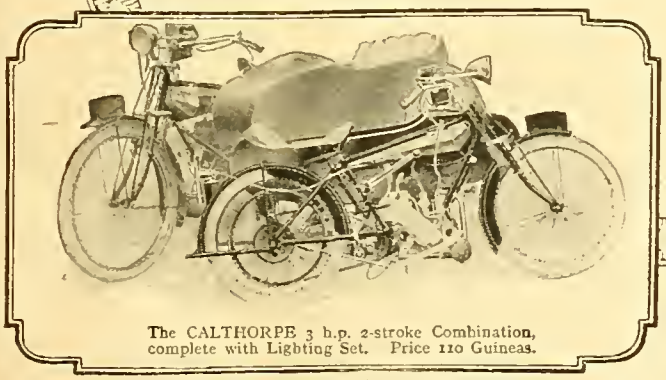
CALTHORPE

Test "CALTHORPE" Value for yourself—compare!



Compare with other makes, the exceptional value offered in the three famous CALTHORPE Models here listed:— The CALTHORPE 3 h.p. 2-stroke Combination at 110 guineas, complete with lighting set: 2¾ h.p. CALTHORPE-J.A.P. at 70 guineas, and the 3 h.p. CALTHORPE 2-stroke at 65 guineas, and then note this:—

Our 3 h.p. 2-stroke Combination at 110 Guineas is practically equal in power to the 3½ h.p. models of other makes listed at much higher prices.

This CALTHORPE Combination will take you and your passenger comfortably up all reasonable hills, and will average 20 to 25 m.p.h. It is light, absolutely reliable, and with an approximate petrol consumption of 75 m.p.g.

Specification includes 3 h.p. PECO 2-stroke engine, patent lubricating system, 2-speed Sturmey-Archer Gear with clutch and kick-starter. M-L Mag-Dynamo Lighting Set, complete with light type, perfectly sprung sidecar.

Note the two small views of Combination, and then call on the nearest CALTHORPE Agent for inspection, or write direct for illustrated catalogue giving full information.

The CALTHORPE 3 h.p. 2-stroke Combination, complete with Lighting Set. Price 110 Guineas.

1921.

For 1921 we are concentrating on an exceptionally high-class 2¾ h.p. Solo Motor Cycle, and a 4 h.p. model which is suitable alike for Solo or Sidecar work. The engine used in each case is the BLACKBURNE, and we have not succumbed to the temptation of fitting the higher powered engine into the Light-weight frame, or vice versa. The two models are separate and distinct, each being specifically designed for its own particular purpose.

The prices are 99 Guineas and 120 Guineas respectively, and we guarantee THESE PRICES TO REMAIN CONSTANT TILL MARCH 1921. Highly finished, luxuriously equipped, and efficient to the last degree, we claim each to be the best in its class on the market.

PERFECTLY VIBRATIONLESS.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisemeot is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

HEPPELTHWAITE'S.—26×2⅜ Beldam, new, £1/5; Bates, £1/5; Dunlop heavy covers, £1/10; 26×2¼ Dunlop retread, 26×2⅜, 17/6; 28×3 grooved Dunlop, £2; all above are new goods. Ask your motoring friends what they think of Heppelthwaite's goods.—19, Wilcox Rd., South Lambeth, London, S.W.8. [5355

26×2½ New Beaded Covers, 30/-; new best quality tubes, 24×2¼ 6/-, 26×2 6/6, 26×2¼ 7/-, 26×2½ 7/9, 26×2½×2¼ 8/6, 26×3 9/6, 700×80 10/6, 750×75 12/6; new rubber belts, 6ft. 2in.×1in., 10/6; 15in. inflators, 2/6; sent approval, carriage paid, receipt remittance.—Palmer's Garage, Tooting, S.W. [5512

MOTOR Cycle Tubes.—Best red quality, with small patch vulcanised by makers: 24×2, 5/3; 24×2¼, 5/6; 26×2, 5/9; 26×2¼, 6/-; 26×2⅜, 6/3; 26×2½, 6/6; 26×2½×2¼, 6/9; 26×3, 7/-; 28×2, 7/3; 28×3, 7/6; 29×3½, 7/9; 650×65, 8/-. All leading makes and sizes in stock.—H. Emanuel, Tyre Factor, 27, Belgrade Rd., N.16. Stores, 37a, Balls Pond Rd. 'Phone: Dalston 3161. [0346

GOVERNMENT Surplus.—Huge stock of specially selected second-hand covers, Dunlop heavy, Palmers, Kempshalls, Clinchers, etc., 26×2¼, 26×2⅜, 12/6 each; 28×3, 17/6 each; new Dunlop and Bates tubes, 26×2¼, 2⅜ and 2½, 7/6 each; goods cash approval.—Homerton Rubber Works, Brooksbys Walk, Homerton, E.9. 'Phone: Dalston 3483. Tel.: Emanrubwor, Hack, London. [0331

TANKS.

TANKS Re-enamelled to pattern. High-class work only.—D. Jenkins and Sons, 6, Richard St., Atkinson St., Deansgate, Manchester. Established 25 years. [1797

TANKS of every description replaced, repaired and re-enamelled at our own works; all kinds of fittings stocked; quick service and reasonable charges.—Send postage for illustrated price list to A. Green, Water St., Chapel St., Salford, Manchester. Tel.: 2191 Central. [0256

BELTS.

A Large Quantity of Second-hand belts.—These belts are like new. I have all sizes, ¾in., ⅞in., 1in., all 6/- per length. By taking 50, 5/- each; by taking 100, 4/6 each. Some of these are complete with fasteners.—J. J. Dooley, 33, Killyon Rd., Clapham, S.W.8. [5541

SURPLUS Government Stock, made by Pedley, Silvertown, Lycett, and Dunlop; perfectly new, cash refunded if not approved; ⅝in.×any length, at 1/7 per ft.; ¾in.×any length, at 1/9 per ft.; ⅞in.×any length, at 2/1 per ft.; 1¼in.×any length, at 2/10 per ft.; special offer of ⅞in. belts in 6ft. 6in. lengths, at 10/- each, and 10¼in. lengths at 17/6 each.—H. Emanuel, Tyre Factor, 27, Belgrave Rd., N.16. Stores, 37a, Balls Pond Rd. 'Phone: Dalston 3161. [0348

INSURANCE.

FOR Insurance of all kinds (specially motor), apply Ernest J. Bass, Insurance Broker, 40, Chancery Lane, W.C.2. [0005

ROYS, Ltd., invite enquiries for insurance of all kinds. Competitive rates for motor cycles. Lloyd's and Companies prospectuses on application.—170, Gt. Portland St., London. [0056

"THE Motor Cycle" Insurance Policy is the policy authorised by "The Motor Cycle," and covers motor cycles or cycles and sidecars used for private purposes. Complete comprehensive Cover. Maximum benefits, minimum rates. Free weekly copy of "The Motor Cycle" to all policy holders paying a premium of £5 or over.—Full particulars and prospectuses on application.—The Autocar Fire and Accident Insurance Co., Ltd., 20, Tudor St., London, E.C.4. List No. 19/2.
Price 7/6 each.

MADE TO LAST.

Made from solid brass, turned and threaded at joints. Every part of solid construction. These lamps may be taken to pieces for cleaning, and will remain alight in the strongest gale. Best quality lenses are fitted, and can be easily replaced if broken. These lamps will last as long as the machines they are used on, and are absolutely rustless.

LICENCE HOLDERS

(For Motor Cycles).

Number plate fitting, as illustrated, complete with nuts and screws
List No. 214. **3/6 each.**
Handlebar fitting, complete with 2 pairs of clips and screws.
Price 4/- each.
MOTOR CAR PATTERN, with complete attachment for fitting to either woodwork or metal work. List No. 216. **3/6 each.**

Westwood Special Lines are stocked by all reputable agents.

TRADE MARK
WESTWOOD RIM & PATENTS LTD
LAWDEN RD BORDESLEY BIRMINGHAM.

SITUATIONS VACANT.

MANUFACTURERS and Concessionnaires ha many lines, require live sales-demonstrators those in a position to take small financial in need apply.—Box 1,185, c/o *The Motor Cycle*.

FOREMAN Wanted, must be first-rate mec thorough knowledge of motor cycles, us handling men; strictly honest and trustworthy.— in confidence, stating experience and terms, Box c/o *The Motor Cycle*.

PROGRESSIVE Motor Cycle Company, Manc district, has a few vacancies for practical men in all branches, who are prepared to take 2 more preference shares at £1 each, to bear inter 10%.—Qualifications, age, and wages required, et be addressed to Box 1,202 c/o *The Motor Cycle*.

PARTNERSHIPS.

PARTNER, enameller, competent all-round £100, good premises, no opposition.—Box c/o *The Motor Cycle*.

WANTED, partner with capital (£500), in lished business (motoring) holding valuable patent rights; Midlands.—Box 1,188, c/o *The Cycle*.

G. WADDEN, the maker and designer of Simplic cycle cars, is desirous of an partner, practical competition expert preferred business abilities; moderate capital.—Letters Wadden, Jessamy Rd., Weybridge, Surrey.

AGENCIES.

WELL-KNOWN Car Selling Company (holdi agencies) with spacious showrooms in Gt. Po St., London, are prepared to accept agency of known light car or high-class motor cycle.—Box c/o *The Motor Cycle*.

CONSULTING ENGINEERS.

ROBERT BAMFORD, A.M.I.A.E. — Indepe advice based upon over 20 years' pra mechanical experience; specialist in carburation speed tuning.—36, 38, and 40, Pelham St., Kensington, S.W.7 (close to tube station). Kensington 7213.

GENERAL TRADE.

AUCTION Sales.—Palmer's Garage, Tooting oldest solely motor auction rooms in Lo terms, 7½%, not chargeable if automobile u Motor cycles bought and sold for cash. Nearest stations: Falcon Lane, L.N.W. Rly.; Wimbledo and S.W. Rly.; and G.W.R.—Sole address, Pa Garage, Tooting, London.

WANTED.

SCRAP Harley Frame, with round head lug.— Hornsey Rd., N.4.

4 h.p. Douglas Frame, good condition.—Cordine Cranston St., Glasgow.

LIGHTWEIGHT Wanted, £20-£30; London. 1,235, c/o *The Motor Cycle*.

WANTED, second-hand A.B.C. sidecar.—J H.M.S. Warwick, Port Edgar.

WANTED, motor cycle trailer, or frame and —Maw, Mowbray Av., Exeter.

2¼ h.p. Motosacoche Engine wanted.—East Cou tage, Lewes Rd., E. Grinstead.

WANTED, Millford Corvette body.—Kennard Plimsoll Rd., Finsbury Park.

PALMER'S Garage, Tooting.—The pre-eminent for disposing of motor cycles.

PALMER'S Garage, Tooting, will make you offer at sight.

PALMER'S Garage, Tooting.—You will be sure good cheque if you sell your machine at Pa Garage.

PALMER'S Garage, Tooting.—Thousands of me sold their machines here.

PALMER'S Garage, Tooting, make a special motor cycles in the weekly auction sale.

PALMER'S Garage, Tooting.—Auction fee for cycles under £50 reserve, 5/-, over £50 10/-. No garage charge is incurred until 7 days' is given.

PALMER'S Garage, Tooting, will collect ma from any London railway station. The sale is held every Thursday, commencing 2 p.m.

WANTED, motor cycle, any make, must be price.—King, Egrove, Oxford.

WANTED, 2½h.p. 1920 Levis or Villiers; £40.—379, High St., Lewisham.

SIDECAR, light, sporting, must be chea Durlston Rd., Upper Clapton, E.5.

WANTED, 2 and 3-speed gear, suit 1911 Hun Edwards, Longwood, Winchester.

2-STROKE Wanted for Cash, complete, sound, c Stephen, 711, Commercial Rd., E.1.

WANTED, countershaft Triumphs, Sunbeams, cheap for cash.—16, York St., Dover.

Continental Competitions in 1921.

IT is clearly desirable that certain competitions in France and other near European countries should receive the support of British manufacturers. There is undoubtedly a certain amount of export trade to be done with the Continent notwithstanding the high duties, because there are always people on the Continent who, appreciating the excellence of British motor cycles, will not refrain from purchasing them.

International competitions are good, not only from a trade but from a political point of view. The meeting of representatives of various countries in friendly competition cannot fail to cement the various understandings and alliances which exist between ourselves and other nations. It is clear, therefore, that the British trade should receive some guidance as to what International competitions to support and what to leave alone.

Races Supported but Trials Ignored.

In the past races have always met with better support than reliability trials, and this is not quite what it should be. Although our opportunities for road racing in this country are confined solely to the Isle of Man, and France is infinitely better off than we are in this respect, this does not mean that reliability trials should be entirely ignored.

Unfortunately, the mishandling of the Paris-Nice competition last year did an incalculable amount of harm. We do not for a moment consider that this sort of thing will occur again, as the French organisers have learnt a bitter lesson, but a proof that the British trade do not appreciate the value of a properly run reliability trial was shown by the lack of support extended to the International Six Days last year—an event which was efficiently organised, and taught a number of valuable lessons to those who took part in it. The opportunity will occur again this year in the International Six Days Trials to be held in Switzerland, and to be run by one of the best organised motor cycle bodies on the Continent—the Swiss Motor Cycle Union. This should certainly receive English support.

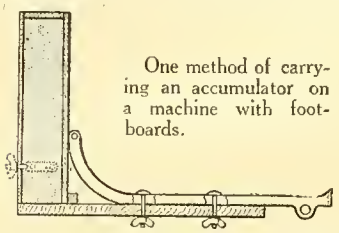
In view of the interest taken by the British Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., in competitions in this country, this body should certainly make a study of events to be held abroad. So far as can be gathered at the present time the most important of these events is clearly the International Six Days Trial. There are to be attempts to run the Paris-Nice Trial again, and a trial from Paris to Madrid. Of these the latter would undoubtedly prove to be the more valuable test, but, unfortunately, neither has yet received the support of the French governing body—the French Motor Cycle Union. Unfortunately, also, both events are not directly organised by responsible clubs, but by newspapers, and the organising of trials by newspapers would never be tolerated for a moment in this country. It is a pity that the U.M.F. does not organise two or three open reliability trials, of a true international character, during the year.

Road Races.

As regards races, there will be the Circuit de la Sarthe, held in October, which is also well organised, and the motor cycle Grand Prix on the day before the classic car race, which will be held on the Le Mans circuit in July. There is also a Belgian Grand Prix, so that there are several important events to which the British trade might give its consideration.

The whole question of trials is under the frequent consideration of that important international body, the Federation of International Motor Cycle Clubs, and after its next congress in Brussels a clearer idea of 1921 competitions will be obtainable.

It would be an excellent plan for the F.I.C.M. to draw up a list of competitions which would deserve support. This would act as a guide to the trade generally, both in Great Britain and abroad. Our object in referring to the matter is to help the British industry and to prevent its members from being misled into supporting competitions which are likely to prove themselves unworthy.



An Index to the advertisements in this issue will be found on the page facing the back cover.

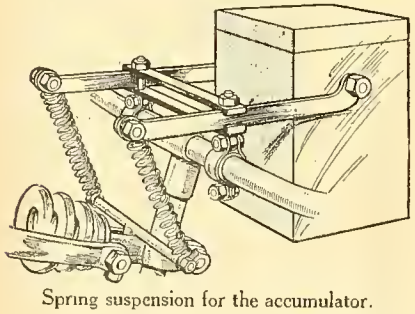
IDEAS: Useful and Ingenious.

A New Accumulator Position.

TO those who have machines with up-turned end footboards this idea of carrying an accumulator may commend itself. The illustration is almost self-explanatory, but modifications might

One method of carrying an accumulator on a machine with footboards.

be made to suit individual requirements. In this case a 40 amp. Fuller accumulator is used with a 4v. 4w. bulb in the head lamp, and another ordinary flash lamp bulb in the rear lamp. C.C. 2320.

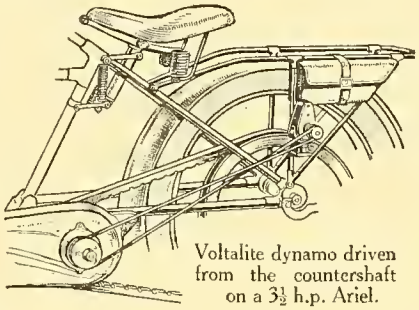


Centring the Speedometer Pinion.

THIS simple little tip may save an hour or two's vain effort to get a silent drive when fitting a speedometer. First fit the large cog to the spokes as nearly central as can be judged by eye, leaving the screws just finger-tight. The small pinion may now be carefully meshed and screwed up hard in approximately the correct position. If the wheel be spun the small wheel will automatically centre the larger pinion, when all screws may be tightened up.

B.E.G.

Spring Carrier for Accumulator.



ELSEWHERE on this page is described a method of carrying an accumulator on the footrest. The neatness of that idea is somewhat discounted by a liability to ill-effects from vibration. To overcome this, a reader has devised the carrier illustrated on his Triumph from an old Miller acetylene lamp bracket. A special T piece bolted through the front spring bracket anchors the two coil springs, and movement is obtained by slackening the bolts at the handle-bar. Locknuts are advisable here. X.Y.Z.

Spring suspension for the accumulator.

Countershaft Drive for Voltalite.

MANY readers are interested in the practicability of using a pedal cycle pattern Voltalite dynamo, particularly for rear lighting. The method of drive we illustrate (adapted to a 1920 3½ h.p. Ariel) has much to commend it over the "rim contact" way. The dynamo is mounted on the forward rear carrier stay, and is driven by an ⅛in. crossed gut belt from a 4in. brass pulley attached

Voltalite dynamo driven from the countershaft on a 3½ h.p. Ariel.

to the clutch spring spindle at the countershaft. Our contributor who effected this conversion illuminates both his head and tail lamps thus from a Voltalite dynamo. A.W.W.

An Easily-made Speedometer Lamp.

FIVE shillings, it is claimed, is the maximum cost of making a speedometer lamp, as illustrated and specified below :

CLIP.—Strip brass ½in. × 1/32in., secured on instrument by 3/16in. nut and bolt.

BRASS ARM.—Strip brass ⅜ × 1/16in.; lower end soldered inside clip.

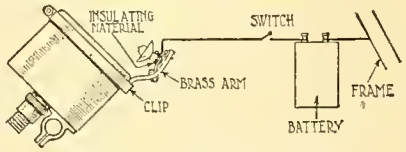


Diagram of wiring and details of a home-made speedometer lamp.

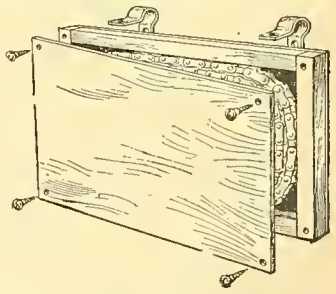
LAMP SHADE.—Adapted from old pocket flash lamp. (Cut out so that it goes over miniature screw holder, as shown.)

BATTERY.—Pocket flash lamp type, with two small terminals soldered on.



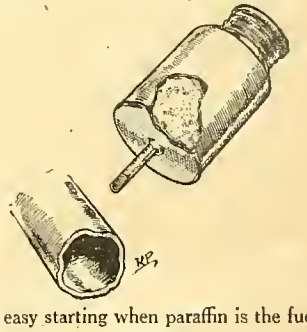
WIRE.—Small gauge copper run in valve tubing.

SWITCH.—Lever switch on saddle tube (or to suit particular requirements).

W.D.W.

Carrying a Spare Chain.

QUITE the toughest problem facin the owner of a chain-drive machine is finding a means c carrying the spare chain. An extremel simple and efficient way out of th difficulty is illustrated. It consists of shallow wooden box which just holds th



Carrying the spare chain—a wooden box for attachment to the carrier.

chain nicely coiled up, and which attache to the rear carrier by four sheet iro clips (two not shown). Three-ply wood is used, and the lid is screwed down by four ordinary wood screws, thus keeping the chain firmly in place. C.G.R.

A Paraffin Starting Aid.

EASY starting is not one of the strong points of paraffin as a fuel, and those who have been driven by increased taxes, etc., to the heavier spirit should find this tip useful. A meta polish tin has a small piece of brass tube soldered to the bottom; the other end

For easy starting when paraffin is the fuel.

of the tube is threaded and screwed into a conveniently placed hole on the inlet pipe. By packing the tin with cotton-wool and then saturating with petrol, a simple wick carburetter is provided which will give a good mixture until the heavier spirit begins to vaporise. C.M.

Readers of "The Motor Cycle" are invited to contribute to this page any ideas successfully adapted to their motor cycles. Contributions will be paid for at our usual rates. Rough explanatory sketches will suffice.

OCCASIONAL COMMENTS

BY "IXION"

A Parable.

I PRESENT the following parable alike to Mr. Brace and to the Chancellor of the Exchequer. I once lived in a little one-horse burg, where there were two garages, run by, let us say, John Jones and Sam Smith respectively. John Jones refused to open on Sundays. Sam Smith, very reprehensively, no doubt, was always open. Sam did more work than John, so made more money. Sam cherished his customers more generously than John, so gradually annexed most of the trade. John is now driving a taxi somewhere, while Sam is probably a mayor and a J.P. for all I know. I have no objection in principle to a four-hour day for labour, and 50% dividend for all capitalists. But I never can see how British labour expects to thrive by doing less work than the similar labour in a rival country; nor how British capital can hold its own if it is prevented from earning as high profits as capital can earn in a rival country. If John and Sam had covenanted together that neither of them would open on Sundays . . .

Cycle Car Engines.

DURING the last month or so I have made extensive trials of many of the latest cycle cars, and in nearly every case their engines display a marked advance over pre-war standards in respect of power and of absence of vibration. Nevertheless, these tests indicate what is perhaps the main reason for the failure of the cycle car to captivate the millions of purchasers who unquestionably exist. *Their slow running is so rough and noisy.* I have known many a well-tuned Sunbeam or Indian motor bicycle, for example, show much prettier manners when running light than the average cycle car power unit can display. The fact that many of these engines can only be restarted by dismounting and getting out a detachable handle, aggravates the trouble; for an owner dislikes all this fuss over a restart as much as he objects to noise and vibration if he leaves his engine running during a brief stop. The full range of the cycle car boom cannot be touched until somebody comes along with a better mannered engine; some flat twins and the 90° V twins show very little vantage over the narrow-angled V twins in this vital respect.

A Useful Gradometer.

MANY a motor cyclist has longed for a lightning and accurate method of measuring gradients, and the accessory merchants have never seen their way to supply it. We need it more than car owners, because the low tyre costs and immense reserve climbing powers of our machines encourage us to rush where a car fears to tread. I cannot say that I have yet discovered the right gadget for a motor cycle, but during the last few months I have been playing with a Tapley instrument. Being manufactured for cars, the brackets in which its adjusting trunnions are mounted have been designed for bolting to a flat dash, and are not easily attached to a handle-bar. Still, I managed to fix it quite rigidly to a Hunt accessory crossbar, and got lots of readings with it. It is sensitive to acceleration and deceleration, but registers very steadily when the machine is driven at a uniform pace On the other hand, it is not calibrated to record any grade worse than 1 in 4. I believe it might pay the manufacturers to turn out a special model with a tube clip at the back, calibrated to read up to 1 in 2. Our freak hill merchants would get a lot of fun out of it. If the surface is so bad that the 'bus cannot be driven steadily, and the needle cannot help oscillating, you can always get a precise reading by stopping.

A Useful Accessory.

IN lieu of the ordinary dry battery torch I am carrying a Parkes "Leverlite" for inspection purposes this winter. I haven't had the pluck—or have I too much sense?—to investigate its innards, but in lieu of a battery it contains a tiny dynamo *à la* Ford flywheel, which is operated by oscillating a shaped lever protruding from the lamp. It is rather expensive (30s.), but saves you the usual outlay on new cells; which of us has not found the bulb glowing dull red like the butt of a cigar just when it has become necessary to dismantle the gear box under a railway arch in a snowstorm? It has another drawback in that one hand is kept busy working the handle, and the remaining hand may prove unequal to working off a new cover. But it is just the goods for sidecar work. Working the handle keeps Arabella's fingers warm while you take off the cylinder; incidentally, after the first ten minutes the task will make her a little breathless and stop her from talking too much.

Electric Lighting Cables.

A FEW weeks ago I asked our readers whether they agreed that "concentric" cabling was really the best, as it is somewhat difficult to repair a concealed short between the core and the casing, such as befel me last summer with this system of wiring, and no spare length of cable available. One reader informs me that he has scrapped the above system in favour of ordinary silk-covered, rubber insulated lighting flex, drawn through rubber tubing, as used for acetylene lamp connections. Short bits of brass tube may be used for joints, if desired. Another reader has given my innocent brain a headache by a learned discourse on megohms, but his notion is that the twin flex should be filled up with jute, bound

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Occasional Comments.—

round with insulating tape, and finally armoured metallically. This cabling is so strong that neither a fractured conductor nor an internal cross short is at all probable; but should such troubles occur, it is a simple matter to substitute the outer casing for one of the inner conductors. He has sent me a sample of this cabling, which is made by the Helsby people. A test piece was hammered flat for a length of 3in., subjected to an end pull of 200 lb. in a tensile testing machine, heated by a blow-lamp till the aluminium armour was red-hot, and finally bent at right angles in two places 3/8in. apart. The insulation resistances at the end of this maltreatment were:

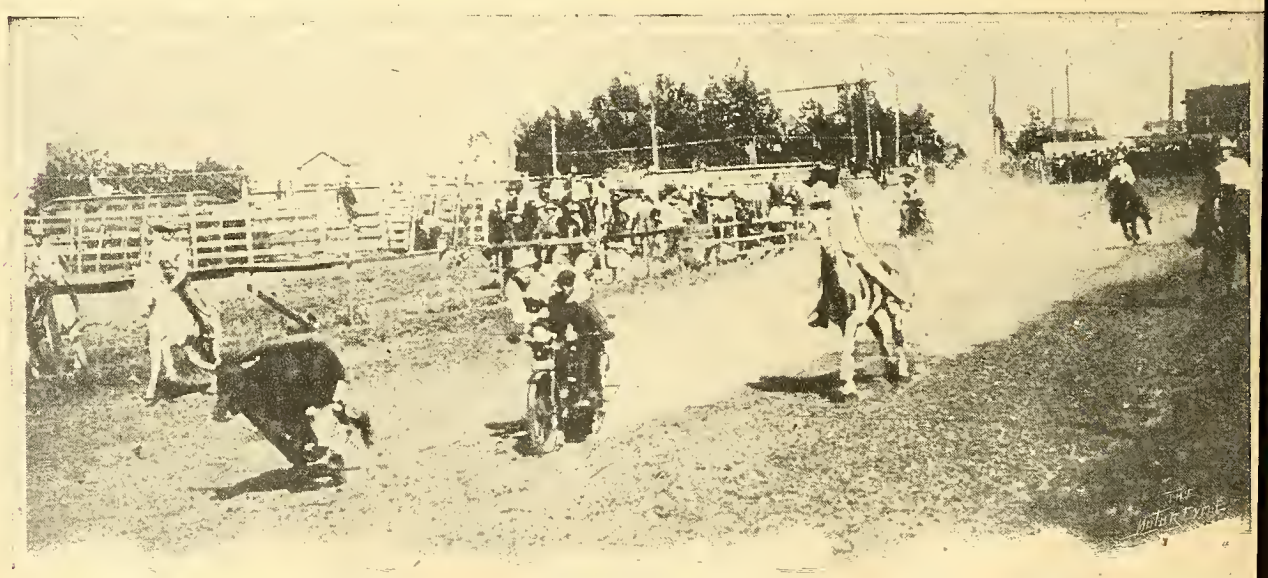
Between the two conductors—8,800 megohms.

Between the two conductors bunched together and the armour—615 megohms.

I don't know what a megohm is when it's at home, but the butchery reads very convincingly, doesn't it?

A Receipt.

THERE lies on my desk at this moment a receipt just to hand for fitting British electric lighting to a British machine. The manufacturer in question has doubtless availed himself of every possible economy. In other words, his motor cycle was specially designed with a view to incorporating a dynamo, and requires no faking for the purpose. His output is large, so that he has presumably purchased his dynamos, lamps, accumulators, cabling etc., at the lowest possible rate. But the charge for the "extra" is £24 15s. retail. I can get a good gas lamp set, suitable for the machine, at about £5 fitted. In other words, exclusive of import duties and adverse exchange rates, electric lighting on this British machine costs me about £20 net, whereas if I had bought a Harley, it would only have cost me £3 10s. Apparently it is not only the magneto industry which demands the tenderest protection if it is to hold its own; for this British dynamo is already protected against U.S.A. to the tune of at least 50% by the favourable factors indicated above. I leave it to our politicians, financiers, and labour leaders to draw the obvious conclusions; and I merely add that all our riders will want electric lighting in the near future, but will refuse to pay 500% more than is necessary for it.



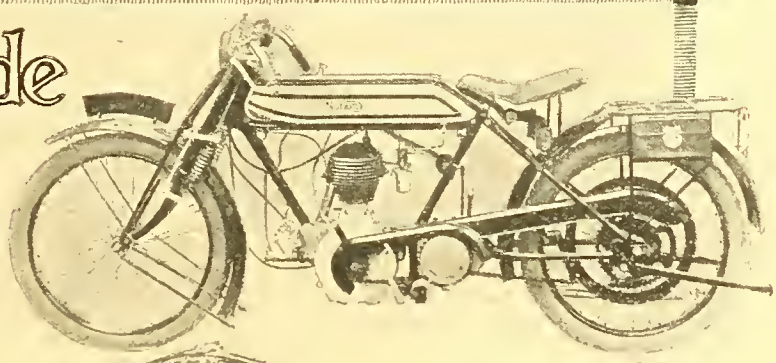
Back to Accumulator Ignition?

THE electrical equipment of motor cycles is in a state of flux at present. There are three principal factors at work. The buying public have not yet had the chance to be convinced that dynamo lighting on two-wheelers is trustworthy: 1920 will have big effects here. Secondly, the supply of dynamo outfits is far below the demand; four makers have professed inability to equip machines about which I have enquired. The third difficulty is cost, since the cost of acetylene and electric lamps is approximately equal, and the dynamo and battery are far more expensive than a gas generator. The first two obstacles will be automatically removed by the passage of time. The third can be met, and may be met, by a reversion to accumulator ignition. Such a change would imply no trade disturbances, since the concerns which now make magnetos would unquestionably make the dynamos. I have a good experience of such an outfit on an experimental machine, and it appears to be absolutely satisfactory. Its main disadvantage is that many users remember the old accumulator ignitions with a savage resentment, whilst they lack experience of the very different service offered by a modern battery with a continuously charging dynamo at its back. Its advantages are two-fold, viz.:

(1.) It will start engines at a far lower speed than the magneto.

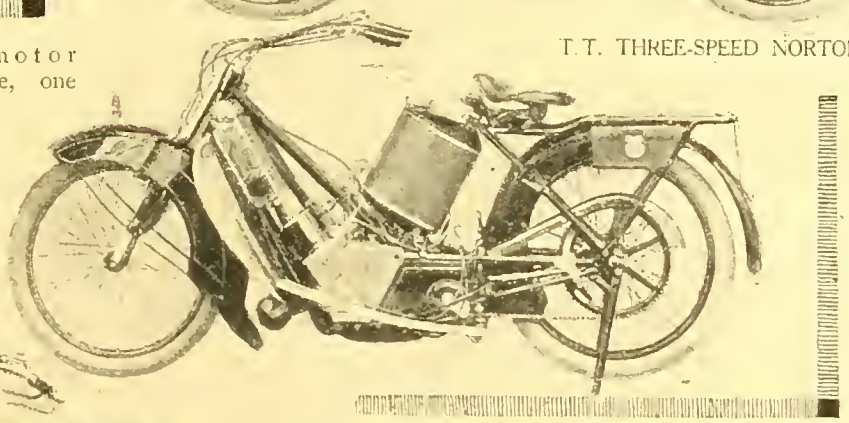
(2.) The combined cost of dynamo-cum-accumulator ignition plus lighting is certainly not greater than that of magneto ignition plus acetylene lighting.

For these reasons I expect more of this equipment in the near future.



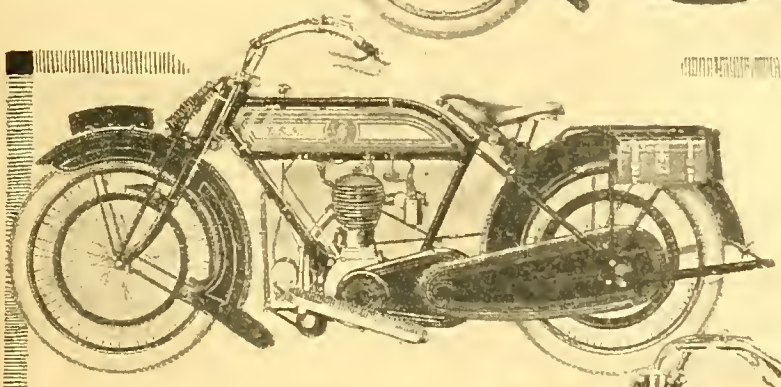
COWBOY SPORT.

The cowboys of the Western States still maintain their reputation as "sports." Here is depicted a motor cycle with passenger on the carrier actually riding in a bull-dogging contest. The object of the game is to catch the steer, grab him by the horns, and throw him; then to tie him up before he can regain his feet. The motor cyclists, who easily out-distanced their competitors on horseback, won the event.



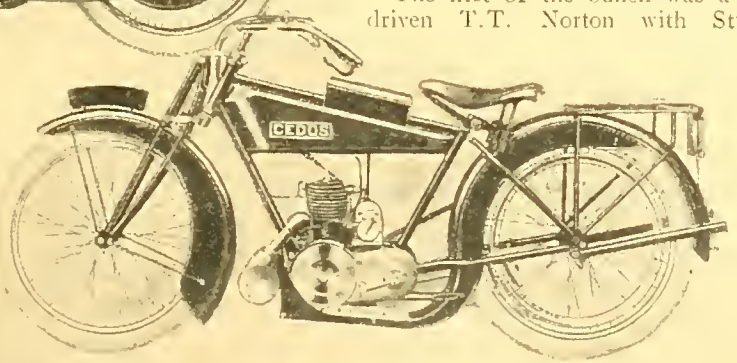
What I Rode in 1920

By IXION

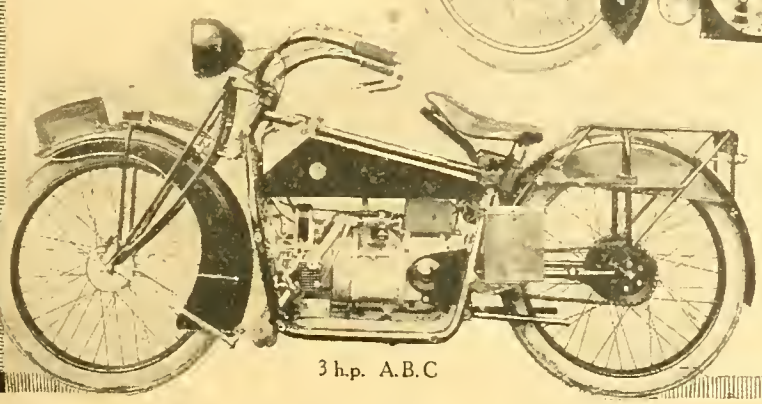


T.T. THREE-SPEED NORTON.

THE motto of many motor cyclists is "one life, one love." They find a machine which suits them, and they remain faithful to its manufacturers' successive models, world without end. Some of us are flirts. No matter how admirably a 'bus serves us, we



3¾ h.p. SCOTT



4 h.p. B.S.A.

ungratefully sample the novel sensations of another make next season. Journalists more or less compulsorily figure in the latter category. So—though 1920 was for its first six months an awkward time for buying, and for its last six months a still more awkward time for selling—it brought me big mileages on four first-class machines of makes which I had never owned before.

The first of the bunch was a chain-driven T.T. Norton with Sturmey-

CEDOS TWO-STROKE

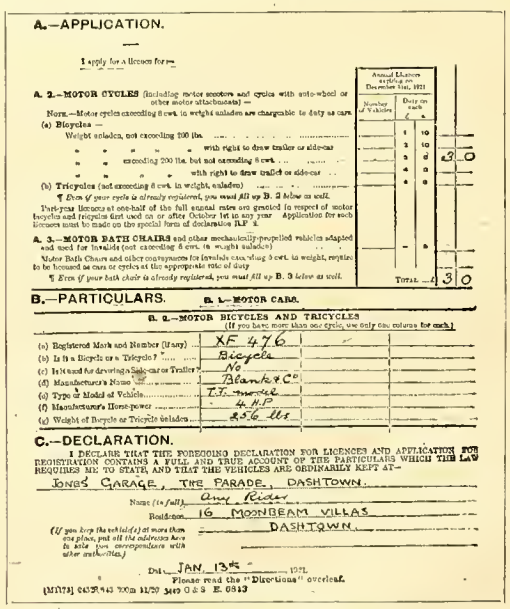
3 h.p. A.B.C

Archer gear box. This machine is, of course, a veritable dreadnought. There is hardly anything on wheels which it cannot catch and leave. Its acceleration is terrific, and its chain drive as smooth as a silken belt running

What I Rode in 1920.—

over ivory pulleys. For competing in trials or for reporting a trial, for high-speed touring, and for general audacity it is at the very top of the tree. Incidentally, it is very cheap to run. It does not break or shed any of its parts. Its fuel economy at speed is equal to that of many engines when they are pottering. As its wonderful cylinder never distorts, it asks for very little oil. Criticisms are quite hard to find. I can only suggest that the foot brake linkage is unnecessarily awkward, and that the nuts ought to be locked. The idea of the footrest mounting is good, viz., that, as it is clipped to a single tube, the clip can slip round in a toss, instead of bending or breaking; but the securing nut is hard to get at. The long plated exhaust pipe looks lovely, but does not come away or go back very easily at decarbonisation times.

The Norton was followed by a machine of very different type—the Scott. I planked down the £10 extra for 3in. Palmer cords, and found the option worth the price. I have never ridden a more comfortable machine. Next to its extreme comfort, the main slogan of the Scott is its safety. On bad going it is easier to steer and better to balance than anything else I know, as Clarence Wood's feats in the Six Days must have suggested to every beholder. I was prepared to find it slow, and I doubt if I ever got better than 45 m.p.h. out of it—I mean a *real* 45, which is quite as fast as many speedometered fifties and fifty-fives. But on the road it is not an easy machine to leave, even for a Norton; you don't have to take corners so cannily on a Scott as is wise on other machines. It wants a little coaxing to start from cold; it doesn't register record gallon mileages; but I mean to have a Scott for part of every year until Anno Domini reduces me to an electric bath chair.



Big Single and Baby Two-stroke.

Then came a B.S.A. I did not know that a single-cylinder could develop so much power. Where the average single is getting a trifle feverish on its bottom gear, the hefty B.S.A. is still slugging calmly away on second. I never unearthed a gradient which could bring her down to first, which I used solely for starting purposes or where the surface put such wind up me that I wanted to climb dead slow. And talk about substantial! The B.S.A. is built like a tank, and is fundamentally incapable of fracturing anything, whilst she creates the pleasant impression that nothing will ever wear out. She struck me as the utilitarian machine *par excellence*—the very 'bus for the hard rider, who goes a long way in any weather, and isn't sure whether he will ever be in a position to buy another machine. Of course, she does not sit up to a speedster, though she can on occasions touch forty with a sidecar. Her weight renders her a little lumpish to handle till she begins to move. But you need never sell her unless you are capricious enough to desire variety for its own sake.

When winter set in, I began to hanker after a baby two-stroke, and as I was already familiar with the pick of the oldsters, a baby Cedos came along. A very pleasant change, too, after a series of heavyweights. Kick-starters are well enough, but there is a certain joy about being able to push start on a 1 in 8 grade without serious exertion. This little two-sroke deserves to be much better known. It is in the same class as the best of the older makes. Economical in petrol and oil, it is well run in at the factory, and doesn't want a lot of humouring when it is new. It two-strokes down to very low speeds on the flat, and its *sostenuto* never changes to *staccato* when you ask it to help itself not too speedily down a light gradient.

A Flat Twin's Qualities.

Through most of the above period I was also running one of the new A.B.C. solo mounts. In one sense this magnificent 'bus disappointed me. On the one hand, it was not quite as good as the original hand-made experimental models rushed through after the Armistice in 1918; for it was a great deal heavier, and the engine was a little less smooth at small throttle openings. On the other hand, the springing was not equal to that of the defunct 1914 model. When I recovered from these initial disappointments, I fell in love with it, as all users must have done. It is one of the very few machines which is equally satisfactory for gentlemanly work of a utilitarian character and as a hogbus, pure and simple. Potter along at legal limit, and nothing will carry you more smoothly. Essay a scrap with a road-burning pal, and he will not get the better of your A.B.C. Its acceleration is a thing apart. As racers measure acceleration on their heartless instruments at Brooklands, there is probably little or nothing between an A.B.C. and a Norton. If you are in a Joe Beckett sort of mood, the heavier punch of the single will certainly be more reminiscent of Moran's famous "Mary Ann." But if you want a jump plus refinement, and prefer to sense acceleration in terms of wind pressure rather than of roar and rattle, why—open the throttle of an A.B.C. with a slam. I know no finer motor cycling sensation than a good scrap over hilly roads with this 'bus, especially when corners and grades make you work the gear lever hard.

A.—APPLICATION.

I apply for a licence for—

A. 2.—MOTOR CYCLES (including motor scooters and cycles with auto-wheel or other motor attachments) —

Annual Licence expiring on December 31st, 1921

	Number of Vehicles	Duty on each £ s.
Note.—Motor cycles exceeding 8 cwt. in weight unladen are chargeable to duty as cars.		
(a) Bicycles —		
Weight unladen, not exceeding 200 lbs.		1 10
" " " " with right to draw trailer or side-car		3 10
" " exceeding 200 lbs. but not exceeding 8 cwt.		3 0
" " " with right to draw trailer or side-car		4 0
(b) Tricycles (not exceeding 8 cwt. in weight, unladen)		4 0

¶ *Even if your cycle is already registered, you must fill up* B. 2 *below as well.*

Pedal-cycle licences at one-half of the full annual rate are granted in respect of motor bicycles and tricycles first used on or after October 1st in any year. Application for such licences must be made on the special form of declaration BF 4.

A. 3.—MOTOR BATH CHAIRS and other mechanically-propelled vehicles adapted and used for invalids (not exceeding 8 cwt. in weight unladen)

Motor Bath Chairs and other conveyances for invalids exceeding 3 cwt. in weight, require to be licensed as cars or cycles at the appropriate rate of duty.

¶ *Even if your bath chair is already registered, you must fill up* B. 3 *below as well.*

TOTAL £ 4 3 0

B.—PARTICULARS. B. 1.—MOTOR CARS.

B. 2.—MOTOR BICYCLES AND TRICYCLES
(If you have more than one cycle, use only one column for each.)

(a) Registered Mark and Number (if any)	XF 476
(b) Is it a Bicycle or a Tricycle?	Bicycle
(c) Is it used for drawing a Side-car or Trailer?	No
(d) Manufacturer's Name	Blank & Co
(e) Type & Model of Vehicle	T.T. model
(f) Manufacturer's Horse-power	4 H.P.
(g) Weight of Bicycle or Tricycle unladen	256 lbs

C.—DECLARATION.

I DECLARE THAT THIS FOREGOING DECLARATION FOR LICENCES AND APPLICATION FOR REGISTRATION CONTAINS A FULL AND TRUE ACCOUNT OF THE PARTICULARS WHICH THE LAW REQUIRES ME TO STATE, AND THAT THE VEHICLES ARE ORDINARILY KEPT AT—

JONES' GARAGE, THE PARADE, DASHTOWN.

Name (*in full*) Amy Rider

Business 16 MOONBEAM VILLAS

(*If you keep the vehicle(s) at more than one place, put all the addresses here to save two correspondents with other authorities*) DASHTOWN.

Dated JAN. 1st 1921

Please read the "Directions" overleaf.

THAT LICENCE—HOW TO OBTAIN IT.

Part of the Inland Revenue licence application form of interest to motor cyclists. It will be seen that the particulars asked for by the authorities on this form are very few more than those required under the old system. The form is filled up as representing the application for licensing a standard 4 h.p. solo mount.

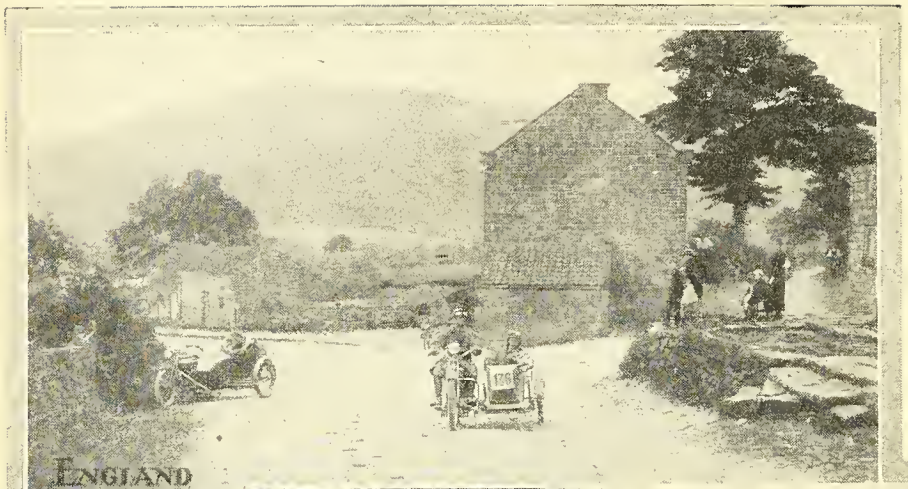
THROUGH THE 1920 TRIALS

Nine Months Experiences By one of THE MOTOR CYCLE Photographers

A familiar figure at the big trials.

The work of a trials photographer entails hard usage for the machine he may be riding. Like those members of the staff who attend the trials in order to record them in "The Motor Cycle," he often covers more miles, and is compelled to drive with less consideration for his mount than the gold medal winners. The writer of this article attended most of the important trials of 1920 to secure the photographs which have accompanied our descriptions of the events, and we commissioned him to relate some of his impressions of, and experiences with, a modern spring frame motor cycle used under such severe conditions.

ALTHOUGH most spring frames are now well through the experimental stages, one cannot deny that they are not so fully tried out as the rigid type. The work of a photographer on the staff of *The Motor Cycle* is such that it precludes anything in the way of experiments, and however much he may desire to ride a new, perhaps unconventional, machine, there is always the responsibility for "delivering the goods," as it were. The possibility of "letting the editor down" by failing to reach the most interesting points in a trial, or by being hung up on the return journey, is an ever-present dread to the man with the camera.



Therefore, it was with some slight misgiving that I took delivery in April last of a 1920 spring frame Matchless. This was due purely to the extra number of moving parts a spring frame involves and the fact that the Matchless was designed primarily for comfort. My chief had also warned me not to experiment, and inferred that my duties were confined to obtaining photographs and did not include testing new machines.

In Holland on the Anglo-Dutch trial—the solo rider is Lieut. Glen Kidston, R.N. (3½ Sunbeam), who accompanied *The Motor Cycle* photographer on the return journey to The Hook, mentioned in the context.

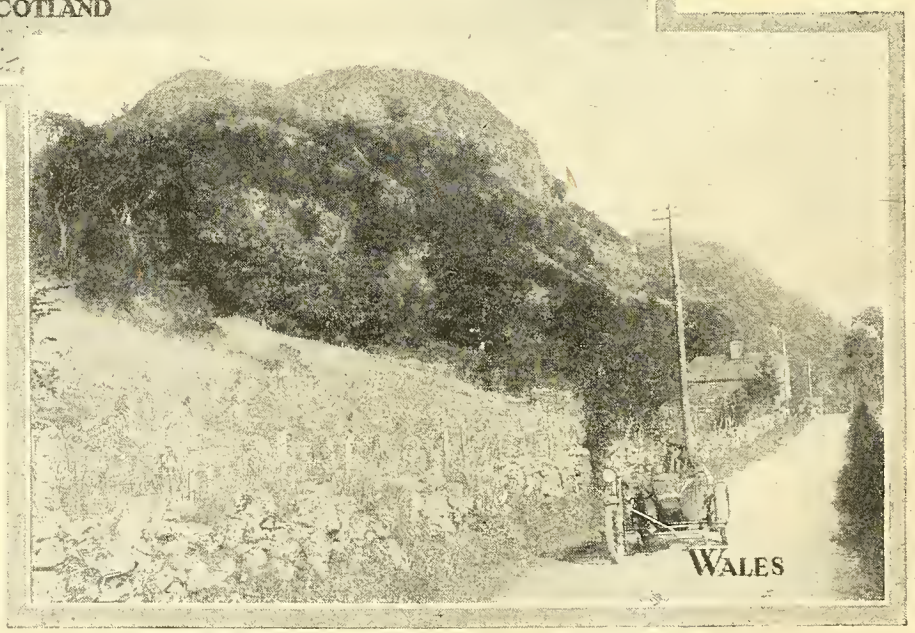
Personally, being on the right side of thirty, I regarded a spring frame as something akin to an old gentleman's bath chair, and the hard riders on the staff waggishly suggested that my choice was a sign that the time was approaching when my physique should be enquired into.

However, my 1919 competition work on a rigid frame, over post-war roads, had convinced me there was something lacking in the rigid

At Chop Gate in the 1920 A.C.U. Six Days.

machine, the atrocious roads of the English and Scottish Six Days leaving me decidedly sore. The spring frame from the Collier house had been in the experimental stage since 1916, so it was no mushroom growth, and for its final trial before going into production, a number of machines were entered for the 1919 English Six Days, and came through without any frame trouble. I will not comment on the severity of that Six Days. Suffice it to say it was of the usual A.C.U. order. All the same, I had to remember that my work did not entail one six days trial, but many.

From April to Christmas the machine covered roughly 10,000 miles, the majority of that mileage being competition work. When I say competition work, I refer to the pressman's side. His job is to cut about over the course to the principal points of interest, a different story from a 20 m.p.h. schedule.



More often than not his machine is all out, for he has to see competitors at one point and be in front of them again at the next—this with a machine that is in commission week in and week out, and therefore receives the minimum of attention.

My first trip with the new machine was the Birmingham M.C.C. Victory Cup Trial, on a Midland course, taking in the Old Wyche Cutting, Birdlip, Rising Sun, Sudeley, and the Colonial section from the top of Sudeley. This trial, with the run up from London and back again in about thirty-six hours, constituted an excellent *début*, and, apart from a somewhat high petrol consumption (a matter of adjustment) was accomplished without trouble.

The next run of import was the London - Edinburgh, the points of interest being the run through

Near Inverness on the Scottish Six Days Trial.

On the M.C. and A.C. One Day Trial—the hardest open trial of the year

Through the 1920 Trials.—

Yorkshire and Kirkstone Pass. I got a day's start, joining the competitors at the breakfast stop at Ilkley. Continuing with them, with various stops *en route* for photographing, the run, excepting Kirkstone Pass, was of the main road variety, with nothing to try the modern machine. The Pass, however, with its three-mile grind, is still a formidable proposition. Coupled with gradient, we had to contend with a thick rain mist which seriously interfered with carburation. The Matchless, being driven well within its power, and taking advantage of the one or two easy grades to get into a higher gear, climbed the Pass without trouble, and after an hour's wait to obtain photographs, the run was continued to the lunch stop at Patterdale.

From Patterdale commenced the hardest part of my work. To enable *The Motor Cycle* readers to get their illustrations, it was imperative that I should be in London the next morning. This necessitated a 300 mile run through the night, not a pleasing prospect after a hard day in the saddle. However, it was a good opportunity to test the Lucas Magdyno set.

An All-night Run.

Leaving Patterdale at 3.30 p.m., a quick run was made to Kendal; here a quarter of an hour stop for tea and replenishments, and so on to Harewood. Here was another stop to fill up, taking sufficient to last through the night. At Doncaster the lights were switched on. After the medium illumination of the average acetylene set, the Magdyno light was a great joy. With one's engine apparently pulling so much better, there is something very fascinating about a night drive behind good lights, and the entire return journey was without incident, the average running time being 21 m.p.h.

A great deal can be said for a Matchless when one can do a 500 miles journey without experiencing undue fatigue. I will refrain from describing the machine's behaviour in other one day trials; in fact, there is little to describe, for, excepting everyday troubles, such as with plugs and punctures, they were without incident.

I always think the Scottish Six Days was my hardest event, my mileage for eleven days being in the neighbourhood of 1,800. I left London with a sidecar packed with a photographic outfit of two cameras, 144 plates, and a portable darkroom—owing to post and train difficulties one has to be practically a self-contained photographic unit; this, with personal luggage, compensated for lack of a passenger.

Scotland and Holland.

The Scottish trial is considered, and rightly so, one of the most sporting events of the year. Any machine awarded a "gold" is deserving of high praise, for added to its severity is the weather.

Of the five Scottish trials I have "covered," only once have I experienced a really fine week. My machine, of course, was not entered for the trial; had it been so, its performance would have merited a premier award, for, beyond punctures and a broken front sidecar spring, it was a week devoid of trouble.

When orders came through for me to attend the Anglo-Dutch event I imagined it would be more in the nature of a holiday, for the actual trial only occupied one day, the remainder of the tour consisting of luncheons, dinners, and joy trips to the well-known touring grounds of Holland.

Anticipations are not always realised. When my chief, a member of the English team by the way, gave me final orders, all thought of a holiday was soon banished. Bank Holiday week had somewhat disorganised press arrangements, so to fit in with them I had to be in London sixteen hours after the trial finished at Amsterdam.

The trial, over a distance of 194 miles, started from Maastrich, South Holland, at 6.30 a.m. on the Saturday morning. This, owing to our hotel being a mile or so from the start, necessitated us rising at the unconscionable hour of 4.30. After spending the

Short cuts often lead one into "awkward corners," and on many occasions the Matchless has been forced to take to the water.

Through the 1920 Trials.—

previous evening at a Dutch banquet, none of us felt particularly fit at that hour, and I for one did not look forward to a long run; for there was a further considerable distance to be covered that day, from Amsterdam to the Hook, to catch the night boat. Judging from the English viewpoint, Holland has no hills, therefore apart from its length there was nothing to worry the competitors. For myself I would rather the trial had been shorter and more severe, for the thought was always uppermost in my mind, that it was a long way to the Hook, and come what may I must catch that boat, and so reach London on the Sunday midday. However, the Matchless was in good tune, so that with average luck I hoped that I should get through.

In a Strange Land.

The run through Holland *via* Venlo, Arnheim, Utrecht, to Amsterdam, although very flat, has a beauty of its own, and was quite interesting. We finished at Amsterdam at 7.30 p.m., and after a hasty meal I set off for the final stage of my journey. Luckily I had a companion in Lieut. Glen Kidston, R.N., a member of the English team, who had to report for duty at Portsmouth on the Monday. Compared with the trial this final run, most of it in darkness, was most trying. On unknown roads, and ignorant of the language, we had the utmost difficulty in finding our way. Getting through the towns was a problem; the Hague in particular was somewhat of a nightmare. We must have wasted nearly an hour when eventually we found a sporting Dutch Harley rider who acted as pilot to within seven kilometres of the Hook. He saved the situation, for without his good offices we certainly should have missed the boat—as it was we only arrived with a quarter of an hour to spare, and but for a generous distribution of tips should have had to leave the machines on the landing stage.

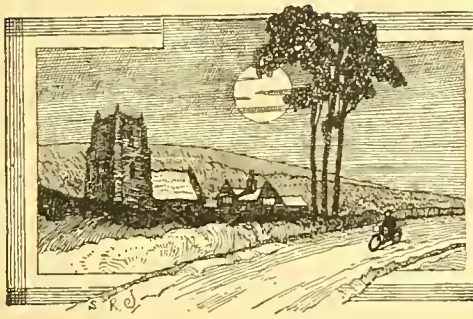
For the Matchless this final stage was the most strenuous; having lost much time enquiring the way, it was a case of full throttle when we did get going. On one of these "all-out" stretches the exhaust pipes were glowing a bright cherry red, but despite this it carried on without the least sign of the engine drying up.

Shortly after this event I noticed that the compensating stay of the sidecar was slightly bent, which I attributed to the rough handling the machine had received in getting it aboard the ship. I was too busy further to investigate the matter, and the Matchless's reliability had made me less careful than I should have been.

My preparations for the English Six Days were hastily made, and on the Friday preceding the trial I made a quick ride to Coventry, picked up a member of the Coventry staff, and continued to Worksop for the night.

Next morning we had to attend a hill-climb at Sutton Bank. This necessitated a final run to Darlington in the dark, over the worst roads on which it has ever been my misfortune to ride.

The damage started on the ship was now completed, for next morning I discovered that the stay was broken. This meant that for two days—while the stay was being replaced—I was without a machine. The first two days of the severest of all Six Days Trials!—These two days were "covered" as a passenger on the Editor's machine.



The Most Severe One-day Event.

Later there were a few one day autumn trials, including that organised by the M.C. and A.C. in Wales—which proved to be quite as severe as anything in the A.C.U. event. With a passenger, the Matchless made no protest on that pass with the fearful surface, known for the day as Boydell's playground, and later climbed Bwlch-y-groes as "fresh" as any of the competitors' machines.

To sum up, I may say I know but few machines giving the same comfort, which would have stood up to the hard usage meted out to my Matchless—M.A.G. in the hands of a press photographer. D.O.

At all times, in all weathers, and at every period of the year, *The Motor Cycle* photographer pursues his way in quest of pictures. The Matchless taking the sharp corner into Mill Hill from Highwood Hill.

SOME ANOMALIES OF MOTOR CYCLE TAXATION.

Sidecar Taxes at £2 10s. Solo Machines at £3.

IT is very clear that there was no motor cycle representative on the committee that accepted the new taxation with so much unanimity. Motor cyclists have, I suppose, come off no worse than car owners on the whole, but there are some points on which we have, I think, not been fairly treated. Still there is one little crumb of comfort which I propose to discuss when my grumble is over.

Much has already been said about the advantage of a tax such as the petrol tax, or a tax on tyres, which makes the mileage covered in the course of the year the basis of taxation. It is fair and just that the man who rides constantly for pleasure should contribute more to the maintenance of the roads than the hard-working man who spends his weeks in workshop or office, and can only get into the country at week ends and on his annual holiday, which is all too short.

There are, however, difficulties in the collection of such a tax which are, I suppose, insuperable, and with this remark I may dismiss the subject, thankful for a reduction of 7d. per gallon in the price of petrol.

TABLE INDICATING THE INCREASE OR DECREASE IN AMOUNT OF ANNUAL TAX PAYABLE BY MOTOR CYCLISTS FOR THE YEAR 1921, AS COMPARED WITH PREVIOUS YEARS. (Compiled by the Auto Cycle Union.)

The registration fee of 5s. or transfer of registration fee of 1s. is no longer payable. This saving is not included in the above figures. *Previously licensed as a car at £3 3s. per annum.

An Authoritative Ruling Wanted.

The tax on weight is a simple one to collect, provided that it is clearly stated what must be included. So far, I have seen no authoritative statement on this point; the licence application form says simply "weight unladen." Does this include the lighting outfit, horn, tools, and spares, or may a machine be weighed in a stripped condition without stand and carrier? Further, the weight limits should be in cwt., not in lb., and the gradations should not be so steep. A difference in tax of £1 10s. for a difference in weight of 1 lb. is far too much. If the scale had been, for solo machines:

Under 2 cwt.	...	...	£1 10 0
„ 3 „	...	...	2 0 0
„ 4 „	...	...	2 10 0
„ 5 „	...	...	3 0 0
„ 6 „	...	...	3 10 0

Sidecars £1 extra.

it would not have met with the storm of opposition called acceptance with wonderful unanimity by the Colossus of Roads (need I say that I allude to the Minister of Transport?) Further, I understand that a constable will be able to hail a motor cyclist to the nearest weighbridge, when, if he has been for a long ride in the wet, he will have the mud of several counties adhering to his machine to the extent possibly of 10 lb. I really do not think that this is an exaggeration, for after about 120 miles through Cornwall, Devon, and Somerset. I once found my front mudguard quite full of caked mud and a good deal in the rear guard. Will the unfortunate motor cyclist have to pay an extra 30s. if this raises his machine above the 200 lb. mark, and will he also be indicted for removing the road surface and converting it to his own use? Possibly the trouble will not end here, and the unfortunate individual will be fined £20 for making an untrue declaration.

Contrasts.

Here again is another curious anomaly: My friend Jones has a motor cycle which weighs 198 lb., and to this he has affixed a sidecar weighing 120 lb. On this machine he and his wife disport themselves about six days per week. Another friend, Robinson, has a solo motor cycle which turns the scale at 205 lb., as many of the Junior T.T. machines did; this he uses chiefly at week-ends and on holidays. I may mention that Robinson is a little man, while Jones and his wife incline to adiposity. Jones's outfit when laden does not fall much short of 6 cwt., while Robinson's is less than 3 cwt., yet Robinson pays £3 and Jones £2 10s.

Some Anomalies of Motor Cycle Taxation.—

Further, certain advantages are granted to car owners from which motor cyclists are excluded. I refer to the issue of quarterly licences. For instance, a car owner can take out a licence for the six months of summer, March 25th to September 30th, for a payment of three-fifths the full duty, whereas a motor cyclist gets no abatement at all unless he takes out his licence on or after October 1st, when he has to pay half the fee, that is five-tenths, against three-tenths, the quarterly fee paid by the car owner. This means that a licence taken out after the end of September for a medium or heavyweight sidecar outfit costs £2 instead of £1 4s., which would be the cost if the motor cyclist received the same consideration as the car owner.

The three-wheeled runabouts under 8 cwt. seem to me to get off very lightly; such a machine may be 12 h.p. and carry four passengers, yet it is taxed the same as a mediumweight of 3½ h.p. with a sidecar attached.

It is, of course, necessary to raise money for road upkeep, and it is, I suppose, unavoidable that the new taxes should bear more heavily on some than on others. The man with the biggest mileage will get off the most lightly. In fact, as the appended table compiled by the A.C.U. very clearly shows, if the mileage is sufficiently large the saving will be considerable. Therefore I do not cavil at the taxes themselves, but at the points where their imposition is distinctly unfair and might have been greatly improved by a little forethought. Nor do I think that the new taxes will ruin the industry or drive all motor cyclists off the road. After all the tax on a heavy sidecar outfit is a small thing compared with the interest, at present rates, on the capital outlay involved in its purchase.

A Crumb of Comfort.

I now come to the crumb of comfort to which I referred. A motor bath chair is taxed at 5s., and what is a motor bath chair? It is defined as a mechanically-propelled vehicle adapted and used for invalids (not exceeding 5 cwt. in weight unladen). This must mean that the machine and not the invalid must be under 5 cwt. but the wording is a little obscure.

Now my wife is an invalid, or at least she is highly strung, which is always reckoned the same thing. I mean that she will not ride long distances on the carrier, because she says it gets on her nerves. What I am going to do is this: I shall attach a luxurious coach-built bath chair on a spring chassis to my machine. The outfit will then become a motor bath chair, within the meaning of the Act, and I shall fill up B3 Motor Bath Chairs and other Vehicles for Invalids, pay a tax of 5s., and all will be well—at least I hope so. This proves that a smart man can always find his way out of difficulties, however insuperable, if he gives his mind to the matter. JAM SATIS.

Solo Mounts and the A.C.U. 350 c.c. Limit.

A Debatable Proposal of the A.C.U.

IN the proposed regulations for the 1921 A.C.U. Six Days Trials there appears the suggestion that all motor cycles of over 350 c.c. shall have sidecar attachments. Now most of the new proposals are most excellent and practical, so that it would seem somewhat extraordinary for the governing body to insert a clause which discourages the production of solo machines of over the nominal 2¾ h.p. class.

It would appear to be fairly obvious that the A.C.U. officials have at the back of their minds one of two intentions (or possibly both). (1.) That each machine of over 350 c.c. shall be capable of carrying an official observer. (2.) That machines designed for sidecar work shall not obtain an unfair advantage by shirking their normal load. Both these ideas have much to be said in their favour, but what about the real solo machine?

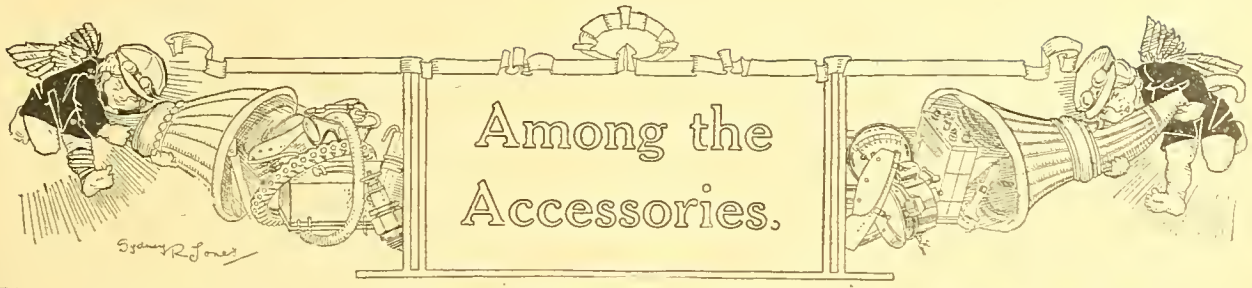
In the past the 500 c.c. solo machine was a popular favourite, and at the present day there are a large number of motor cyclists who still consider that it is the ideal mount. Unfortunately this type has been spoiled from the solo rider's standpoint by being stiffened and modified for sidecar work. This fault is apparently to be encouraged, instead of eliminated.

It is one of the first duties of the governing body to improve the breed of motor cycles, but it is surely rather hard on the solo rider to be told that no solo machine of over 350 c.c. is worthy of encouragement, and such firms as the Sunbeam, Douglas, Brough, Brough-Superior, N.U.T., Norton, etc., to say nothing of other well-known concerns who have special solo models on the stocks, will hardly appreciate the new ruling.

As one of the many keen solo riders I am all for the development of the light and handy 3½ h.p. solo machine having a good flexible engine and a two or three-speed gear with rather high ratios, and no unnecessary "frills."

Simplicity, economy, and handiness are the watchwords of the average solo rider, and it is up to those who are responsible for the sport to encourage these attributes not only in the smaller classes, but in every class.

It was noticeable at the Olympia Show that some of the 500 c.c. machines were lighter than 350 c.c. machines of broadly similar specification. Are these machines to go without their reward?

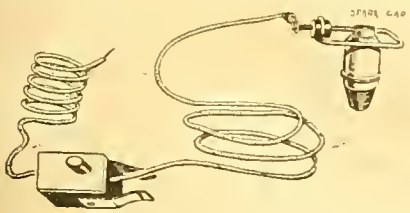


Would it not be possible, in order to avoid shirking, to formulate a combined weight and capacity rating in order to decide which machines were suitable for sidecar, and which for solo purposes?

Such a scheme would penalise heavy solo machines to the advantage of the lighter makes, and it would not be difficult to arrive at a suitable weight limit for each class of engine capacity.

This is merely the suggestion of a solo rider, but it can hardly be said to be prejudiced, since that rider is also a regular user of a sidecar for the purposes for which it is intended.

Possibly better suggestions will be forthcoming, but at any rate it is to be hoped that the existing A.C.U. proposal will not be brought into force without some modification, lest the army of solo riders secede in a body from an organisation which discourages the development of their favourite type of motor cycle.

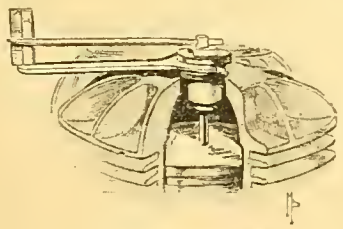


UBIQUE.

YEAR by year the accessory market is filled and refilled, until one obtains an impression that there is nothing left to be devised, yet every week sees new and useful articles offered to the motor cycle public, by whom they are appreciated according to their merit. Just now lighting sets and other articles appertaining to winter riding are being introduced, but there are many other novelties which will have an appeal all the year round. On this page we illustrate a batch of new accessories recently introduced.

An Automatic Lamp Lighter.

An ingenious idea for lighting an acetylene lamp by means of the magneto has been carried out by a reader, Mr. J. C. Williams, Roberts Wall, Penally, Pembroke. It consists merely of a length of wire, a handle-bar switch, and a spark gap designed to attach to the burner of an acetylene lamp. The wire leading to

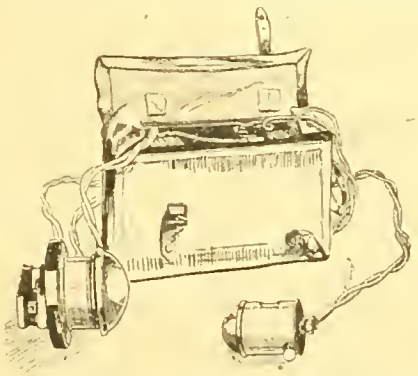


J. C. Williams's (Penally) acetylene lighter

the switch is connected to the switch terminal of the magneto while the other wire from the switch goes to the spark gap on the burner. The fact of pressing the button allows the spark to pass across the spark gap, by which means the lamp is said to be lighted without any necessity on the part of the rider to dismount.

A Simple Timing Device.

The timing device illustrated is the invention of another reader, curiously enough with the same name, Mr. J. C. Williams, 92, Court Road, Barry Dock, and has previously been referred to in the Correspondence columns of *The Motor Cycle*. It is quite an ingenious little fitting, designed to screw into the sparking plug or compression tap hole in the



J. C. Williams's piston gauge

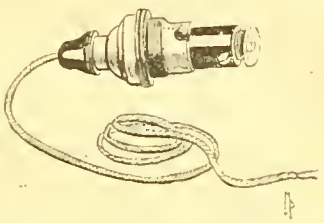
cylinder. Consisting of a spring plunger, it has on the upper end a pointer by means of which a reading may be obtained on a three-centimetre measure. By means of the device the timing of the valves and ignition can be accurately effected.

Dry Battery Lighting Sets.

For short distances, especially in the areas round towns, where great illumination is not required, a dry battery set is most useful on a motor cycle. That placed

The Bancroftian lighting set for lightweights

on the market by the Bancroftian Co., 64, Bishopsgate, London, E.C.3, is to be recommended. It consists of a small head lamp designed to fit on to an ordinary lamp bracket, a neat tail lamp, and a dry battery in a neat cloth case provided with straps to attach it to any convenient part of the machine.

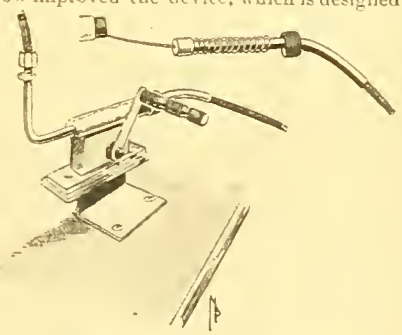


The Imperial Scouts overall.

Defying the Weather.

The same firm has also placed on the market the Imperial Scouts overall, made from the best brown gabardine, specially waterproofed, and all in one piece. It should be highly suitable for serious competition riding, as it appears to be perfectly waterproof, and protects the rider admirably. A helmet is included with the outfit, which is quite moderate in price.

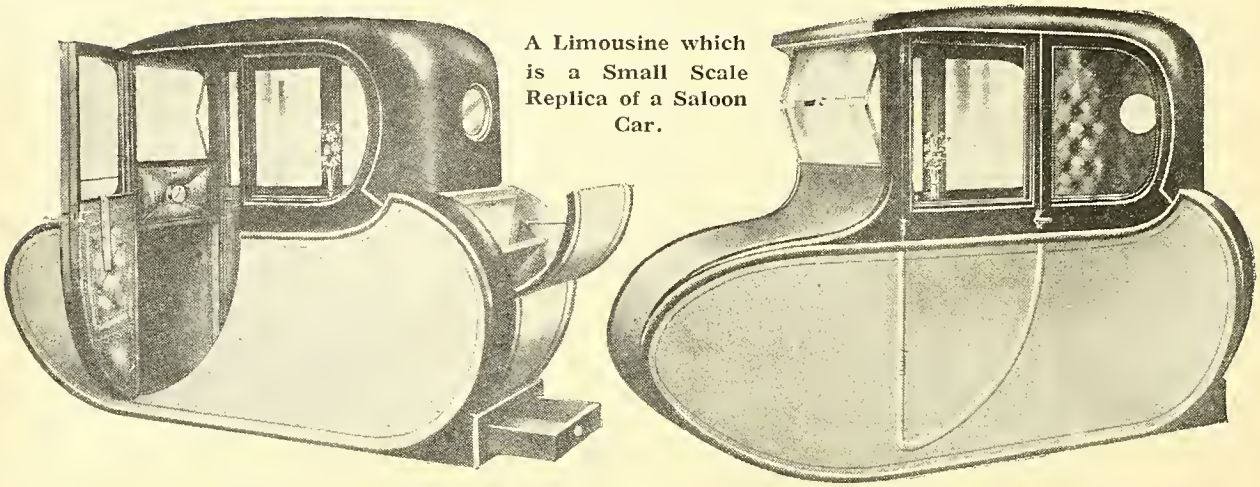
An Electric Bulb Adapter.



The failure of an electric lighting outfit is distinctly inconvenient, as in the event of a sudden failure miles from anywhere it is often impossible to get a repair carried out by an experienced electrician, whereas, at any cycle shop or fancy store, flash lamp bulbs and batteries may be purchased. This ingenious little adapter sold by Messrs. Turner's Cycle and Tool Stores, 181-182, Railway Approach, Shepherd's Bush, London, W., is well worthy of review. It consists of an ebonite holder, one end of which will take an ordinary flash bulb, while the other can be fitted into an ordinary S.B. socket. The adapter is made in two forms, either with a single pole fitting or with a double pole contact to the lamp socket. One of our illustrations shows how the adapter may be used in an ordinary lamp socket as an inspection lamp, when it can be wired up to a "flash" or other dry battery.

Turner's lamp adapter; it enables a pocket lamp bulb to be used in bayonet fittings

A Motor Cycle Accelerator.



On previous occasions we have referred to the accelerator pedal which is the invention of A. F. Edwards, The Burroughs, Hendon, London, N.W. He has now improved the device, which is designed

Edwards's motor cycle accelerator pedal

to attach to the footboard of a motor cycle. By its means a pedal, connected to the throttle, may be operated independently of the handle-bar lever, thus allowing a rapid acceleration to be effected.

Luxury in Sidecar Bodies.

A Limousine which is a Small Scale Replica of a Saloon Car.

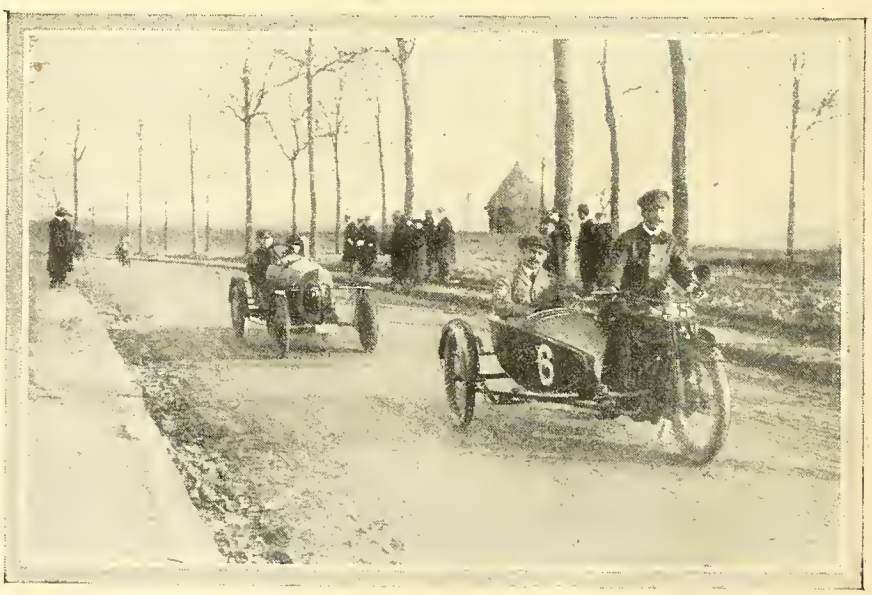
Imagine this sidecar for shopping purposes and city use! Such a vehicle could be used to advantage by those who have a car, which might otherwise be engaged

THERE are many uses for a saloon type sidecar which have not yet been acknowledged. Where a closed car is used for shopping by the lady members of a large family, a motor cycle with a sidecar such as is illustrated here could be used as a tender with a uniformed youth as the chauffeur. Certain it is, a body of the quality of the Jasmine limousine, as it is called, would in every way be more dignified than a taxicab, which frequently has to be called into service when the private car is engaged.

As a sidecar for the motor cyclist, too, it will no doubt appeal, as it is often found that it is not the driver so much as the passenger who grumbles about the winter.

The sidecar body under review is a product of Messrs. Dunhills, Ltd., 359-361, Euston Road, London, N.W.1, and is a replica of a small scale of a luxurious saloon type of car body. Though solid in construction, it is comparatively light; it weighs about 85 lb. to 90 lb., and, internally and externally, the appearance leaves nothing to be desired. The framework is coachbuilt throughout of well seasoned timber, the panels being of the best Venesta three-ply birch, and the top panel of beaten aluminium. The windows are of triplex safety glass.

Petrol Consumption Tests in Paris.



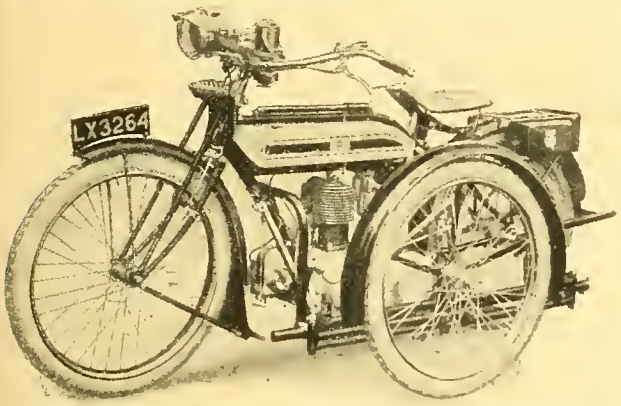
THE Boxing Day attraction in French motor cycle circles was a fuel economy competition, held in the southern suburbs of Paris, on the basis of one litre of fuel. For the sake of simplicity, the same amount of petrol was given to each competitor, whether he had a tiny scooter or a comfortable two-passenger sidecar, and each had to run until his 1.76 pint had been used up.

Under these conditions it was not surprising that the greatest distance was covered by a motor-assisted bicycle. The machine, a Cyclemotor, ridden by Pouget, travelled 50.6 miles before its engine spluttered and stopped. This is at the rate of 28.7 miles on a pint of fuel, or over 229 m.p.g.

The most economical scooter was a Monet-Guyot, which covered 41.6 miles. In the 250 c.c. class an Alcyon, ridden by Guignet, was first with 48.5 miles, or 27.5 miles on a pint. There was very keen competition in this class, Alcyons getting first, second, third, and fourth prizes out of thirteen to finish. In the 350 c.c. class the professional rider Dubost, on a machine of his own construction, was the winner with a distance of twenty-three miles. Barthelemy, on a 500 c.c. Norton, made a very fine performance by covering 30.7 miles, or practically seventeen miles to the pint (136 m.p.g.). The Rover, which came second, with a distance of only twelve miles, was obviously not in form.

A B.S.A. sidecar beat an F.N. in the 750 c.c. class by running a distance of 10.8 miles, compared with 9.5 miles for the Belgian machine. An Ariel took first place in the 1,000 c.c. sidecar class with 14.3 miles, defeating an important lot of American machines and one Matchless.

Sandford's air-cooled Morgan was the most economical cycle car, with 15.8 miles for the litre, or nine miles to the pint. The Elfe, a French machine, came second, and another Morgan third.



In France sidecars and four-wheeled cycle cars compete together. A movement is afoot which may bring about the introduction of this desirable practice in this country.

FOR NARROW GATEWAYS.

Detail Improvements to a Well-known Collapsible Sidecar.

MANY motor cyclists who desire to use a sidecar, and have not room to keep it at home, are faced with the prospect of weekly garage bills and the risk of having the machine knocked about. To such unfortunately placed motor cyclists the Paragon folding sidecar should make a strong appeal. It has been on the market for a long time, and has thoroughly proved its reliability.

It is one of the earliest practical forms of folding sidecars, and is sold by the Wincycle Co., Ltd., 236, High Holborn, London, W.C.1. We have described the device on many occasions previously, and it is sufficient to state that it folds up quickly, is absolutely safe, and is a thoroughly practical article. The body and springs are removed in a few seconds, and the chassis itself folded alongside the motor cycle, which can then pass through a 30in. doorway. For 1921 some considerable improvement has been made in the fixing of the mudguard, which is now very strongly secured. When extended it is not possible to distinguish the Paragon chassis from that of any other sidecar.

With the body removed and the chassis folded the Paragon will pass through a 30in. doorway.

When in use the Paragon folding chassis is not distinguishable from any other sidecar.

LICENCE CARD HOLDERS.

Twenty more Firms who Make Carriers at Various Prices.

IN addition to the thirty odd licence card holders we have described in *The Motor Cycle* (issues December 17th and 24th), the following are also producing holders at prices varying from 1s. 3d. to 7s. 6d.

Millfords, Ltd., Bullock Street, Birmingham (a continued front number plate and holder, 7s. 6d.).

Harrison and Co., Bradford Street, Birmingham.

Eastern Garage Co., 418, Romford Road, Forest Gate, E.7 (5s. brass, 6s. 6d. plated, with clip for handle-bar).

H. Foster, 41, Mersey Street, Warrington (polished aluminium, 3s. 6d.).

James Grose, Ltd., Old Jewry, Cheapside, London, E.C.2 (aluminium, for number plate or handle-bar, 2s. 6d.).

Central Aircraft Co., 179, High Road, Kilburn, N.W.6.

J. W. Brooks and Co., Ltd., Criterion Works, Birmingham (in polished aluminium, attached by leather straps).

Graiseley Motor Accessories, Ltd., Church Lane, Wolverhampton (in aluminium 3s. 6d., in brass, nickel-plated 4s. 3d.).

Device Engineering Co., 33, Clerkenwell Close, London, E.C. (for front number plate 5s.).

E. Reed and Sons, Ltd., Carlton Works, Daubeney Road, Clapton, E.5 (with clip 6s.).

Stanley and Hill, Ltd., Buckingham Street, Birmingham (with bracket, 5s. 6d. black finish, 6s. nickel-plated).

R. R. Evans, Milverton Garage, Cross Road, Leamington (5s. brass finish and 5s. 6d. nickel finish).

Mole and Son, Ltd., Newhall Street, Birmingham (5s. 6d. nickel finish).

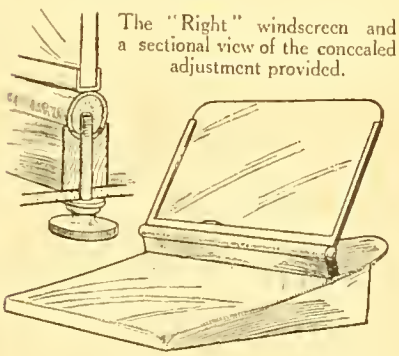
Benetfinks, 107, Cheapside, London, E.C.2 (in brass for attaching to front forks 5s., for screwing to sidecar 4s., in aluminium for fixture to front number plate 2s. 3d.).

Cycle Accessories (Birmingham), Belfrey Works, Spiceal Street, Bull Ring, Birmingham (for attaching to front fork, 3s. 9d.).

Cowey Engineering Co., Ltd., Archer Works, Kew Gardens, Surrey.

Capac Co., Ltd., 2, Woodstock Street, Bond Street, London, W.1 (The Tredelect holder).

Wates Bros., 132, Charing Cross Road, W.C. (a neat holder without projecting screws, 6s. 6d.).



Northern Motor Exchange, Marion Street, Sunderland (combination number plate and licence holder).

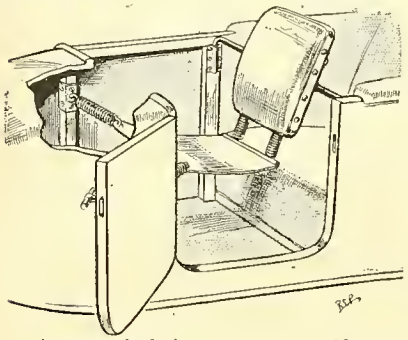
Stewart Engineering Co., 34, Mortimer Market, Tottenham Court Road, London, W.C.

Mason Leather Co., 20, Charminster Road, Bournemouth (made of waterproof fabric, 1s. 3d.).

A SIMPLE SIDECAR SCREEN.

THE windscreen has become almost universal on the modern sidecar, right from the very light sporting to the luxurious big twin types. Illustrated on this page, the "Right" screen is suited, and may be easily fitted, to any type of body. Its chief characteristic, however, is the ease with which it may be adjusted to any angle.

The "Right" windscreen and a sectional view of the concealed adjustment provided.

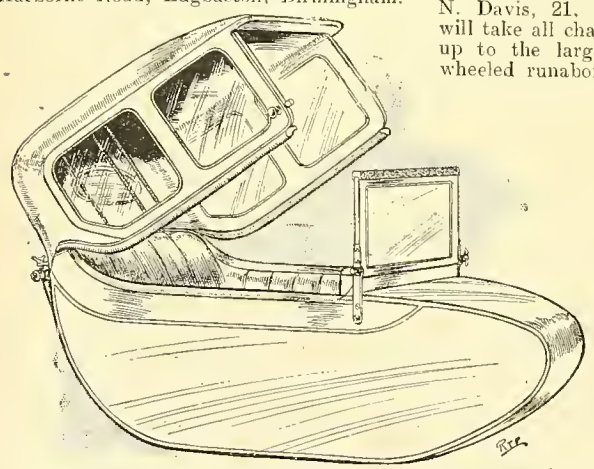


A tube, seated in a grooved piece of hard wood on the dash, carries the screen proper. Inside the tube there is a nut of round section, and engaging this nut through a slot in the tube there is a stud operated by a milled nut right underneath the dash. The makers are the Right Windscreen Co., Borrowash, near Derby.

WESTERN CENTRE A.C.U.

ENTRY forms and particulars for the Western Centre Open Reliability Trial starting April 8th, 1921, will be available shortly. The trial regulations have been so framed that the private owner entrant should have an equal chance with the trade, rider to gain highest honours. There are a number of special awards, including "The White Challenge Cup," "Sunbeam Gold Medal," first and second prizes for amateurs, and a special prize for the best performance by a lady.

AN AUXILIARY SIDECAR SEAT.



THE fitment illustrated is called the Stanford "Spring Slung" seat, and the double name provides a good indication of its characteristics. So far, the majority of such auxiliary seats have been rigidly mounted on the sidecar floor, where they were rather apt to cramp the rear passenger's legs. In this case, referring to the illustration, it will be seen that the back rest is mounted on a bar (which is split centrally to allow the seat to hinge clear when pushed to one side). The actual seat portion is slung from the back rest and from supports further up in the nose of the body by two pairs of coil springs. When the upholstery is in position, the rear springs are covered in. Comfort for both passengers and easy detachment are the chief advantages claimed for this attachment, which is made by the Stanford Sidecar Co., Sampson Road North, Birmingham.

A new method of carrying an extra sidecar passenger—the Stanford "Spring Slung" seat.

A CONVERTIBLE COUPE SIDECAR.

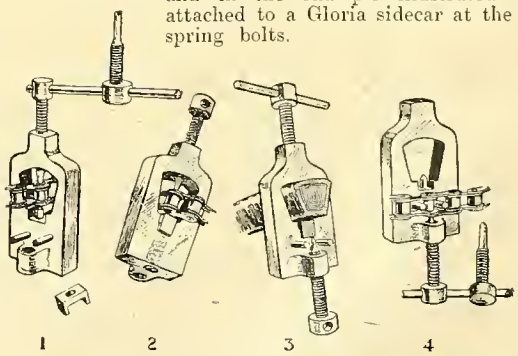
THE elaboration of the sidecar proceeds apace, and, although the idea of a sidecar coupé is far from new, there are several extremely neat points included in the specification of a patent body designed by Mr. W. H. Burleigh, of 421, Harborne Road, Edgbaston, Birmingham.

Operated by means of balance weights or internal levers, the hinged top of the Burleigh coupé sidecar may be raised, lowered, or completely removed.

By means of balance weights or an internal arrangement of levers (not shown in the illustration) the top portion may be readily hinged back, as shown, to allow entrance to and exit from the car. In fine weather, of course, the whole coupé part may be removed, leaving an ordinary open type body. Another commendable feature is the joint between the body and the top, which may be made weatherproof by suitable long felt or air-cushioned rubber pads.

In this construction the sidecar may be kept of normal height and the passenger may get in or out without any crawling tactics.

AN INGENIOUS TOOL.



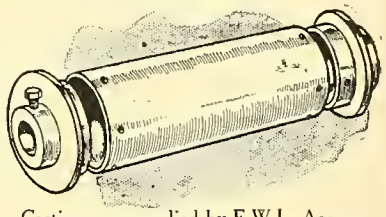
THERE are plenty of devices on the market for extracting rivets from chains, but we do not know of many which will replace the rivet as easily as it is removed. Moreover, there have been no chain rivet-cum-belt punching tools for machines with the double transmission.

The little tool under review is just as invaluable in the case of a chain-cum-belt as in the case of an all-chain drive motor cycle. If the chain rivet remover is unscrewed the belt punch may be inserted in its place, and when the rivet remover is in position the handle of the belt punch acts as a tommy bar. The instrument consists of a main body in which there is an aperture of such a shape that it will accommodate a 1in. belt or a §in. belt, if the latter is inserted upside down. The spring plunger acts as a guide when it is desired to remove a chain rivet, while a distance piece is provided to replace the rivet or when drilling a hole in the belt.

To replace a rivet, the distance piece is placed in position; the link is slipped over, the rivet ends placed underneath, and the chain rivet is centred, when pressure exerted on the top screw will force the rivet into position, when the point of the device will spread the head sufficiently to render it quite secure.

When a roller has been broken the chain is slipped over the two supports immediately over the boss at the bottom of the main body of the tool into which the rivet extractor may be threaded.

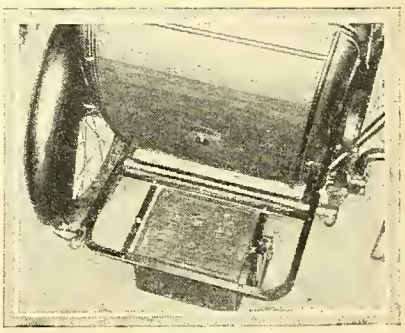
This tool, which is the invention of Mr. N. Davis, 21, Cambridge Road, Luton, will take all chains from the magneto size up to the large chain used on three-wheeled runabouts.



1 2 3 4

Many uses for one tool—the Davis patent combined chain and belt punch used (1) as a rivet remover, (2) replacing a chain rivet, (3) as a belt punch, and (4) when chain roller is broken.

AN ADAPTABLE EXPANSION CHAMBER.



THE E.W.L. Accessories Co., of 102, Lancaster Road, East Ham, E.7, has recently placed on the market a complete set of parts which can be easily made up into an expansion chamber of any length up to 20×4in. in diameter. The set consists of two substantial aluminium castings and a length of sheet iron tubing. The castings, of course, fit into the end of the latter, which can be cut down to any convenient length.

Castings as supplied by E.W.L. Accessories to make up silencers for existing machines.

A NEAT LUGGAGE GRID.

SIMPLICITY and strength are the claims of the Sheldon spring luggage grid, which is being introduced by the Sheldon Engineering Co., toolmakers, Bayley Lane, Coventry. It consists of a simple framework of angle section steel, this construction allowing a safe inverted bed for the spare petrol tin, and in the example illustrated it is attached to a Gloria sidecar at the front spring bolts.

Shown fitted to a Gloria sidecar, the Sheldon luggage grid is neat and strong.

LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

INTEREST IN A COMPREHENSIVE SPECIFICATION.

Sir,—Will Mr. Max Young kindly tell us when his motor cycle, upon which he is now working, is likely to be placed upon the market? TWO-STROKE.

Worthing.

AN IMPROVISED LICENCE HOLDER.

Sir,—Some of my fellow readers who have been or are amateur photographers may find a quarter-plate printing frame and an old dry plate with the film removed a suitable means of displaying the licence. I intend to screw a ring bolt at each corner, placing a felt pad between the back of the frame and the tank. C. C. ROBERTS.

Sir,—With reference to the new licence holders, I believe, without exception, that all are made with handle-bar or number plate attachment.

Personally, I do not think more unsightly or inconvenient positions could have been adopted, and unless I can obtain one for attaching to the tank I intend fitting my own. In this respect, I suggest that it should be made after the style of a wrist watch, with a strap from the top and bottom of the holder, but not passing down the back. A felt or rubber back should be provided to prevent chafing of the enamel.

Bournemouth. CONN ROD.

FIRTH OF FORTH FERRY CHARGES.

Sir,—I wish to draw the attention of your readers to the great and unreasonable increase of charges for conveyance of motor cycles and cars across the Forth by the Granton and also the Queensferry ferries. The charges were: For motor cycles, 1s.; sidecars, 1s. 6d.; motors in proportion. Now they are: Motor cycles, 5s.; sidecars, 7s. 6d.; two-seaters, 15s.; and four-seaters, 20s. The distance covered by the Granton Ferry is about five miles; at Queensferry about one mile. The charges are now the same. Travellers who refuse to pay these charges and yet wish to cross the Forth will require to go up the river about twenty-five to thirty miles. The ferries are in the hands of the railway companies.

Kirkliston. JUNO.

OVERHAULING AN ILL-USED MORGAN.

Sir,—I have read with interest your contributor's article on "Overhauling an Ill-used Morgan," and I must congratulate him on the thoroughness, and, I hope, the success of his labours. Many of the defects with which he has had to deal could not possibly occur in the new models; I have done, and am doing, my best to eliminate such causes of trouble. It is one of the advantages of the Morgan that, for those who are less painstaking and who have not the skill of your contributor, an old model can be brought thoroughly up to date at a comparatively small cost at our works.

Of course, a good many machines are spoilt by careless treatment. There seems to be a mistaken impression that because a machine costs little it should receive little attention. Insufficient lubrication is at the bottom of many troubles. Judging from the condition in which some cars return to us, the owners have never used an oilcan. It is important to examine nuts, pins, etc., occasionally. I could wish that all owners of Morgans took as much interest in their machines as your contributor—though it would ruin our repair shop! May I add that at any time, should he need it, I should be delighted to give him any assistance that I can H. F. S. MORGAN.

MORGAN MOTOR CO., LTD.

ARE MOTOR CYCLISTS FICKLE?

Sir,—Might I suggest that the statement contained in the front page of *The Motor Cycle* of December 30th, to the effect that "the majority of motor cyclists . . . keep their machines for only a year," is open to serious doubt?

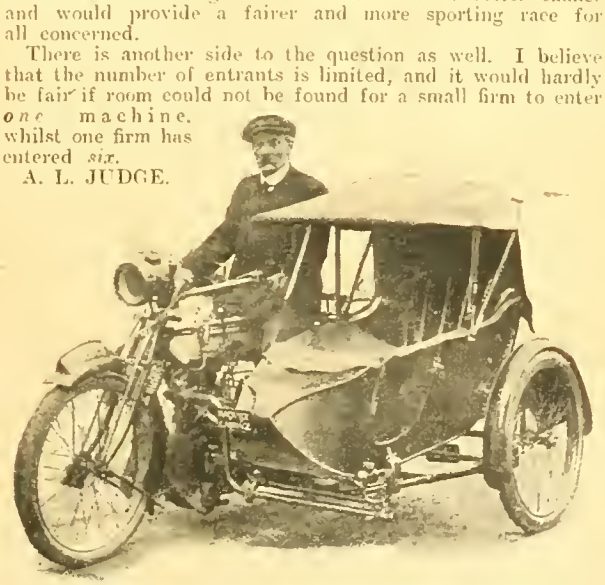
There are, undoubtedly, a large number of enthusiasts who reverently worship the fetish of "the current year's model," and who spend an anxious time at the annual Show in consequence—but I feel sure that there must be a far greater number of enthusiasts who, after many a glorious mile astride their favourite 'bus, and many an hour of anxious care in tuning, grow to love its every nut and bearing, and to sympathise with its every idiosyncrasy, and feel a positive heart-ache when the moment of parting does come: and who, rather than face this eventuality, prefer to continue with their old love until the march of progress renders a change imperative.

The opinions of other of your readers on this subject would, I venture to think, be of interest.

Reading. CRIMSON RAMBLER.

THE 1921 T.T. RACES.

Sir,—I notice that one very big firm is entering no fewer than six machines in the Junior T.T. Race this year, and I feel I should like to learn other motor cyclists' views as regards this.



My own view is that such an entry of so many machines from a big firm, which is already very well known for its "speed 'buses," and which could, no doubt, easily afford to enter even a dozen specially "worked upon" machines, is rather unsportsmanlike, and not at all fair to the small firm which has yet to make a name for itself.

Should not the A.C.U. limit the number entered from any individual firm to, say, three machines?

This would then give the smaller firms a better chance and would provide a fairer and more sporting race for all concerned.

There is another side to the question as well. I believe that the number of entrants is limited, and it would hardly be fair if room could not be found for a small firm to enter *one* machine, whilst one firm has entered *six*.

A. L. JUDGE.

Hull Watch Committee is to be congratulated on issuing licences to taxi-sidecars without a lot of ridiculous quibbling. This outfit, a 6-7 h.p. Ariel, was the first to be licensed in that city.

HIGH-TENSION LEAKS.

Sir,—On starting up a Douglas machine in the dark recently, I was surprised to see a sparking to "earth" where the H.T. cables were suspended from the tank. The insulation was in good condition, and, although it does not affect the general running of the machine, it cannot, in my opinion, be conducive to efficiency.

I then tried a P. and M. machine where the magneto runs comparatively slower, but the effect was the same.

I should think, when dealing with such high-tension currents the cables would be "bushed" in ebonite or insulated better where they are clipped to the frame.

E. TURNER.

THE 2⅜ H.P. DE DION IN THE LONDON-EXETER.

Sir,—May I say a few words with reference to the recent M.C.C. London-Exeter-London trial?

First of all, I would like to thank the driver of the sidecar machine who so kindly stopped on Chard Hill and supplied me with a tin of petrol, and also left behind a Mills-Fulford spanner. If he will communicate with me I shall be most happy to forward on to him the value of tin and contents.

I also have a K.L.G. plug belonging to a Sunbeam rider with whom I became acquainted at the Isle of Man during the T.T. week last July.

I am sorry to be the cause of so much trouble to these two gentlemen, but hope they will excuse me, and that they did not suffer any inconvenience.

It may be of interest to know that I did eventually reach home, *via* Exeter and Staines, under my own power.

B. F. C. FELLOWES.

A.A. TELEPHONE KEYS.

Sir,—Your correspondent "Bled Dry (2)" alleges that the A.A. advertisement in your issue of December 16th, 1920, is misleading. As the advertisement states, our roadside telephone service is provided free of cost with the exception of fees for trunk calls. In view, however, of the high cost of maintaining this roadside telephone service, which service will be still more costly under the new telephone rates announced by the Government, the small fee of half-a-crown is charged for the key which opens all the boxes.

This extra small charge is fully justified by the fact that, although a motor cyclist member of the A.A. pays half the subscription charged to the motor car member, he is entitled to all the advantages of membership enjoyed by the latter.

If "Bled Dry (2)" will refer again to the advertisement, he will find that there is nothing misleading in it, and nothing to warrant his assumption that the subscription, which, by the way, is not mentioned, is inclusive.

STENSON COOKE,
Secretary Automobile Association and Motor Union.

MUDGUARDING AGAIN—AND SOME EXPERIENCES WITH A RADIAL.

Sir,—As a motor cyclist since the days of dry batteries and wipe contacts, I have become more surprised as the years have passed that we are still offered and we still buy machines which it is impossible to ride when the roads are wet if it is desired to keep the person clean. Water from above does not matter much, as rainproofs made for such use can be obtained; but water and mud thrown up by the front wheel act as a deterrent to the use of a motor cycle on many occasions.

While writing, I might mention my experience with the Redrup radial engine, which may be of interest to some of your readers. My engine is fitted into an ancient Triumph frame, with three-speed hub gear and the *tout ensemble* makes a very useful, light, and economical machine. Although I do not indulge in high speed, I find that my averages are exceedingly good, and far better than with my previous mount—a high efficiency single—due no doubt to the quick pick up and magnificent acceleration of the radial. The smooth running of this engine has to be experienced to be believed, and for me singles and twins, nevermore. The lack of vibration at high speeds is another noteworthy feature, as is also the extreme ease of starting. My mileage with this engine is about 4,000, and I have experienced no mechanical trouble of any kind.

I should like to give a hint to those who are running engines of this make which will result in greatly improved running. The aluminium disc on the inlet side of the crank case should be removed, also the cam ring; the locating stud should now be withdrawn and the bronze ring taken out. A paper washer with holes to go over the nine studs should now be made to fit *between* the faces (which touch) of the bronze ring and the *inner* aluminium disc. It will then be found, owing to the elimination of this fruitful source of air leaks, that greatly improved carburation and an increase in power will result. The jets should be adjusted (with the makers' automatic carburetter) so that full throttle cannot be given until the engine is hot.

J. THORNTON.

STANDARDISATION OF CONTROLS.

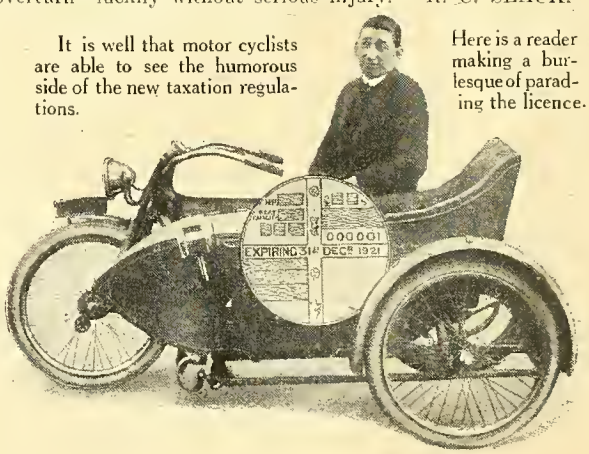
Sir,—I have read the A.C.U. suggested standardisation of controls with interest, but fear I cannot agree that such are best, although quite open to be convinced, and would suggest that the committee give some reason for the various suggestions.

JAS. L. NORTON,
NORTON MOTORS, LTD.

Sir,—With reference to the standardisation of controls as advocated by the A.C.U., I should like to suggest that the clutch and exhaust valve lifter should be interchanged. It is nearly always necessary to move the hand along the handle-bar to reach the extra lever, and as the clutch is much more freely used than the exhaust lifter, it is more convenient to have the clutch lever in the inverted position, as is the case with the A.B.C.

P.-V. JAMES, Lieut.

Sir,—I have just read the recommendations of the A.C.U. with regard to the standardisation of controls, and was surprised to see that some of their most important decisions were arrived at by reason of the fact that several motor cyclists are also in the habit of driving cars, and therefore the foot brake and clutch should be adapted to car practice. As a practical motor cyclist who has experience of nearly every type of machine, I think the positions they have decided on for these fitments are not at all suitable. Although appreciating the fact that in several respects motor cycles would be improved if car practice was more nearly approached, yet I think if the foot brake is on the right in cars there are reasons why it should be on the opposite side on motor cycles. In the first place, it is very often necessary to operate the foot brake and the kick starter at the same time, which would be impossible if placed as in the A.C.U. recommendations; and, secondly, the foot clutch should be in the exact position specified for the brake, as everybody knows that it can be very much more sensibly manipulated by the right foot than by the left; and, thirdly, the majority of British makers who still cling to the foot clutch fit it on the right side, and doubtless they must have some reason for doing so.



J. T. SMALLWOOD.

Sir,—I noticed some of the reasons against the A.C.U.'s suggestion for the brake on the right-hand side, but one point against it which has occurred to a friend of mine might be included. He is rather short, and recently when driving a sidecar he had rather a nasty smash. He was taking a left-hand corner, and, owing to his size, he had to lean over rather to reach the brake pedal. In so doing the changing over of his weight caused the machine to overturn—luckily without serious injury.

R. C. SLACK.

It is well that motor cyclists are able to see the humorous side of the new taxation regulations.

Here is a reader making a burlesque of parading the licence.

OILING THE A.B.C.

Sir,—I do not think that Mr. Mortimer Batten's system of oiling an A.B.C. engine would prove very satisfactory, as separate drip feed glasses would have to be fitted on each cylinder, and it would be a continual nuisance adjusting the drip. By the way, I do not know whence your correspondent got his idea of an A.B.C. piston, which has a pronounced waist. The crank case suction idea does not work well, as the faster the engine goes the less oil is drawn into the crank case; the ball valves do not work quickly enough to form an effective vacuum. It is fatal to underoil an aluminium pistoned engine, as seizures are so sudden, and the aluminium grooves the cylinders, even if seizure does not take place.

There is no lateral play in an A.B.C. spring frame at all.

Why has someone not taken up the spring frame used on the old A.S.L. made by Air Springs, Ltd? I think this was nearer to perfection than any other. R.N.

Haslar.

Sir,—I was interested to note the letter of your correspondent, Mr. H. Mortimer Batten, in your issue of December 23rd, 1920, wherein he commences, "I agree with 'Ixion' that Mr. Bradshaw might have arrived at a better system of oiling for his otherwise beautifully designed A.B.C."

Without wishing in any way to interfere with the very good feelings that have always existed between those responsible for the production of the A.B.C. and myself, and fully conscious of the difficult task they had in organising such production, I feel that, in justice to myself, it is not out of place to mention that the oiling system fitted to this machine was not the one designed by me.

The original one supplied with the designs has been in constant use by Emerson in all his track work with consistent success, and is a mechanical oil pump driven off the front of the camshaft. GRANVILLE BRADSHAW.

SNOW PLOUGHING.

Sir,—The following account of a trip from Portsmouth to Plymouth, carried out during the recent severe weather, might be of interest to your readers. The speedometer distance is 180 miles, and the machine used was an 8 h.p. New Imperial and sidecar (new in April).

I left Portsmouth at 9.30 a.m. on Monday, the 13th, with about 5in. of snow on the ground and a keen N.E. wind blowing. My sidecar was loaded with luggage to about the weight of a light person, so I had no qualms about its tipping up too easily. Needless to say, I wrapped myself up pretty well, and wore two pairs of socks, two pairs of gloves, and a thick sweater under my coat. Throughout the whole run I hardly felt the cold at all, except my feet, which got very dead at times.

To my surprise, on leaving Portsmouth the snow gradually thinned away, until, on arriving at Southampton, I found none lying at all. The roads were in excellent condition, hard and dry.

In the neighbourhood of Chard I ran into snow again, which had apparently only just fallen, but it was only a light powdering, and did not stop me in the least. This snow I had with me all the way into Exeter, where I arrived at 3.50 p.m. Here I stayed for tea and a warm up, and, after lighting my lamps, left at 4.30 to complete the last forty-four miles of my journey into Plymouth. Immediately on leaving Exeter the snow got appreciably deeper (about 3in.) and I had to go more carefully. After half an hour's riding I found my lamps beginning to give trouble, and after spending a little time in investigating, I found the water in both my generators frozen solid. I had to take off the generators and take them into a cottage to thaw before I could go on. On crossing Haldon Hill the snow got much deeper, and it was with great difficulty I got along at all. It was very dark, and the whole country under snow made it very difficult to stick to the road. However, by going slowly, and continually stopping to examine signposts, I made Chudleigh and then Ashburton at 6.40 p.m., so that it took me two hours to do twenty miles. I decided this was not good enough, especially as I was getting tired, so I put up here for the night.

Next morning I continued my journey at 9.15. The first five miles out of Ashburton the going was good, but after that the remainder of the journey had to be done entirely on second gear as far as Plympton. The snow round Ivybridge was up to the bottom of the sidecar, and five times I was stopped dead in drifts, and had to clear away several yards of snow before I could get on. The skidding was tremendous, due to the slipping of the back wheel and the drag of the sidecar in the snow. I eventually had to lash rope round my back wheel to obtain road grip.

My machine ran simply splendidly the whole journey, and my average consumption was 53 m.p.g., which, I think, was good, considering that seventeen miles was done on second gear. Taking it all round, it was a most successful trip, but one I do not wish to do again under similar conditions.

JOHN D. A. MUSTERS, Lt. R.N.

RUNABOUTS AND SIDECARS.

Sir,—The three-wheeled runabout has been the Cinderella of the motor house. In the cycle car boom of 1913 some critics (including one of the most eminent, Mr. Massie Buist) denied that the three-wheeler had part or lot in that matter. All cars had four wheels, therefore the three-wheeler was not a cycle *car*. It was equally true, of course, that no cycle has four wheels, therefore the four-wheeler was not a *cycle* car. Therefore, there was no such thing as a cycle car. Q.E.D. However, the boom passed, and the term "cycle car" became a reproach rather than a distinction, so the three-wheeler was admitted—not, I suppose, for its merits, but for its defects. We have changed all that, and to-day the three-wheeler appears to be coming into his own. Those who have retained faith in it are surprised at the kind things which are said of it. Unfortunately, only one maker remains to hear them—Mr. H. F. S. Morgan. The rest (they were many) are gone, or have exchanged three wheels for four.

But we must not be too sanguine. Even Mr. Morgan would not, I am sure, venture to say that, because the three-wheeler has attained a certain degree of popularity the days of the sidecar are numbered. It is quite possible that some manufacturers who turn from the sidecar to the three-wheeled runabout will find that they have made a mistake. In the first place, it is significant that only one machine out of many has survived ten years. Most have succumbed in two or three. Moreover, only one three-wheeler has as yet competed successfully against the sidecar. I do not say that there is not sufficient reason for this. I only state a fact. But until the runabout has competed successfully the position of the sidecar is secure. No doubt a certain number will make good in this respect this year, but it remains to be seen whether successes will outnumber failures, and every failure sets back the day of the runabout. Taking one consideration with another, it would seem that the runabout has still to fight its way, and the way to fight is successful competition. The road to success is the open road. To dethrone the sidecar is a great adventure, and "adventures are to the adventurous." That I think is the meaning of the much criticised criticism of the A.C.U. report.

Stoke Lacy. H. GEORGE MORGAN.

TWO YOUNG ENTHUSIASTS.

Master and Miss Berry, of Crediton, whose mount is a Velocette fitted with the popular Tan-Sad seat. In this fashion they enjoy the sport, and are loud in praise of their economical and easily manipulated machine.

SIDECAR V. FARM CART.

Sir,—This picture was taken on arrival home with a load of oats in the straw after a journey of six miles. The machine is a W.D. Clyno (gun carriage), on which a sidecar body has been fitted. The oats were loaded at the back on a large carrier, and over the sidecar, being securely roped on. While

How an ex-W.D. Clyno was made useful on the farm is told in the letter of Mr. Frank Leat.

not taking so much as a cart, several journeys can be done in the time of one with a horse, and I can assure you the load was a good one, extending as it did far back behind the sidecar. — FRANK LEAT.

TWOPENCE A MILE—INCLUSIVE.

Sir,—I thought that your readers would be interested in the following record of the cost of running a 4 h.p. motor cycle for one year, which has been ridden both solo and with a coachbuilt sidecar. Distance run in the year 8,380 miles (to date, 13,270). Total cost of running for one year £49 7s. 3½d., made up as follows: Tyres, £6 12s. 6d.; petrol (105 gall.), £16 8s. 5d.; lubricating oil, £3 10s. 5d.; carbide, £1 5s. 1d.; etceteras, 19s. 11d.; repairs, adjusting, etc., £11 9s. 11½d.; club subscription, insurance, etc., £3 17s.; and stabling, £5 4s.

Distance run with first plug, 8,390 miles. The first belt ran for 12,225 miles, but now is too short to put on. One valve burnt through in three months, and again at thirteen months, but the last time it was owing to clearance not being correct.

HISTORY OF TYRES.—No. 1 back tyre. Ran 3,659 miles, and was then put on the sidecar. Afterwards it was retreaded and put on the back wheel for 966 miles, when it was again put on the sidecar, transferred to the front wheel for 134 miles, and then put back on the back wheel for 379 miles, and can still be used.

No. 2 front tyre. Ran for 5,878 miles, when it was retreaded. Then it did 2,175 on the front and 23 on the back, and now, so far, has done on the front 3,298 miles, and is still on.

No. 3, sidecar tyre. Taken off and wants retreading; but no separate record kept of it.

No. 4. New tyre put on back wheel, and when it had done 4,428 miles it picked up a nail on the tramway in Town and cut it through. It was then vulcanised, when it ran for 23 miles. After being retreaded it was put on the sidecar, and has run so far 1,294 miles.

No. 5, new tyre. Did 655 miles on back wheel, when it was spoilt by a cut from a stone. I then had it vulcanised, and it ran on the back wheel for 193 miles and then burst through again. EUSTACE PARSONS.

"IXION" BLUSHES AGAIN!

Sir,—I have just finished reading "Ixion's" extremely interesting book of "Reminiscences," with which I can only find two faults, viz., various paragraphs in the first part of the book are almost repeated in the later chapters, and the fact that the book is all too short. I should like to suggest, therefore, that he immediately sets about writing Volume II., as he must doubtless have had thousands of interesting experiences of which we have heard nothing during his twenty years of motor cycling. The book should certainly be illustrated by that excellent artist Mr. F. Gordon Crosby, whose motor drawings are extremely fine (as witness the illustration of a three-litre Bentley in your Christmas number).

To revert to "Ixion," I am sure that, in common with me, there must be many hundreds of your readers who are wondering what manner of a man this is who supplies us with our weekly page of lies, and I should like to suggest therefore that a photograph of him be published without delay. A. ARNOLD.

[We refer our correspondent to our heading to his letter!—ED.]

AUTOMATIC LUBRICATION AND CARBONISATION.

Sir,—Having seen letters in *The Motor Cycle* for and against different methods of oiling, I would like, in gratitude, to offer a testimony to the merits of the automatic system on the 4 h.p. Douglas, as this I have found practically perfect.

After "running in" the machine with a liberal setting, I adjusted the by-pass to reduce the flow, and set the drip-feed to pass fifteen drops a minute, since when, beyond filling up the sump and occasionally draining off, I never give oiling a thought.

During the last four months I have been over two thousand miles (including six hundred in Devonshire) sometimes three up, and when taking out the valves this week I find positively no carbon on them, or on the valve caps—merely a very slight deposit of soot which was rubbed off with a rag. I have never had a sooted plug.

West Ealing, W.13. FORTY-EIGHT.

CUI BONO?

Sir,—I beg to suggest that surely some British motor cycle firm of repute might build a racing machine that would be able to attain and surpass the terrific speeds reached by American machines, notably the Indian motor cycle.

It is well known that the wonderful speed of 115.79 m.p.h. was recently accomplished at Daytona Beach.

Hitherto, only the Matchless has reached anything in the neighbourhood of 100 m.p.h., besides, of course, the American machines—Indian and Harley-Davidson.

Why does not one of the firms that used to build "racers" before the war produce a really fast machine, that would be a rival to the big American racing motor cycles?

There are a great many British firms that manufacture big twins. Surely one of these might build such a machine.

Most English racing motor cycles that have broken records at Brooklands are single-cylinders and small twins, such as Norton, 2¾ h.p. A.J.S., N.U.T., Diamond-Jap, and others.

In this coming season I hope to hear of such a machine.

Eaton Square, S.W.1. J.K.D.C.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"MOTOR CYCLE REMINISCENCES." By "IXION," of *The Motor Cycle*. An interesting and amusing description of early motor cycling experiences, with many unique illustrations ...	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C., or of leading Booksellers and Railway Bookstalls.

Fuel Economy.

The R.A.C. is urging that motorists generally economise in fuel by reducing the size of their jets.

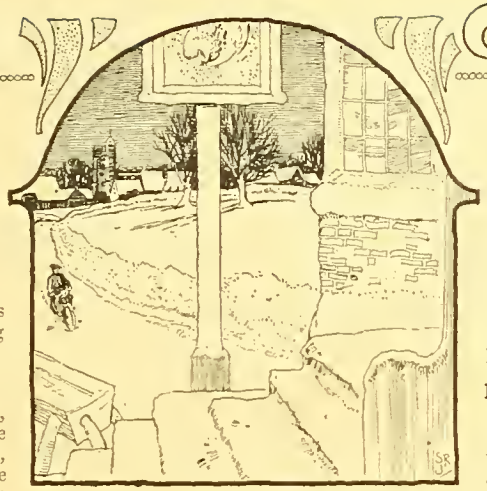
Hard Luck on the Navy!

An A.B. writes: "Being what I am, and only home for a few days in the year, and only then ride my machine, must I pay the whole tax? Is there no rebate? There must be thousands in the Navy similarly placed."

The New Licences.

From the number of letters we have received on the subject it appears that motor cyclists do not yet realise that a motor cycle licence need not be taken out in respect of a machine which is not in use.

A Dutch Exhibition.



Friday last, the 7th inst., marked the commencement of the Amsterdam Motor Cycle Exhibition, which will continue open until the 17th inst. The Royal Dutch Motor Cycle Club has a stand, and on it a pleasing display is made of the awards gained by the various competitors in the 1920 Anglo-Dutch Trial. Another interesting exhibit on this stand is a series of illuminated transparencies (taken by *The Motor Cycle* photographer) showing various incidents of the trial.

Taxation of Cycle Cars.

The present system of taxing all four-wheelers irrespective of their size, on the £1 per h.p. basis, is a severe handicap to those who might otherwise seriously experiment in this direction. On the new taxation scheme the smallest four-wheeler, like the Black Prince Buckboard, which has a 350 c.c. engine and weighs less than a sidecar outfit, is subject to the minimum car tax of £6, whereas £4 covers the taxation on three-wheelers up to 8 cwt. Surely it would be only fair that all vehicles of the same weight were classed together?

Dazzling Head Lights.

We have received a report from the Ministry of Transport, the gist of which will prove that the Ministry has been by no means idle as regards the testing of anti-dazzling devices for motor car head lights. The Sub-committee of the Departmental Committee on Lights on Vehicles, consisting of General Holden, Colonel Jarrott, and Mr. A. S. Straker, A.M.Inst.C.E., has been attempting to solve the question. Tests are being carried out contemporaneously by the R.A.C. These are of a difficult nature, but it is to be hoped that they have been carried sufficiently far to justify definite recommendations being made to the Minister of Transport in six or eight weeks.

Made in Germany.

Speaking at a meeting in Birmingham recently, Mr. Chas. Sangster, managing director of Ariel Works, Ltd., said that he knew of a case where a British syndicate had been to Germany and purchased 14,000 German bicycles (less tyres) at £2 each. These machines were an exact imitation of a well-known British machine. In the meantime the price of British bicycles is in the neighbourhood of £10—and many of the men who make them are on short time.

The Position of Licence Card Holders.

In a notice recently issued by the Ministry of Transport concerning the position of licence card holders we find the following words: "The position in which the licence card holder is to be carried on the vehicle shall be . . . in the case of motor cycles (including motor scooters, motor cycles with trailer or sidecar, tricycles and invalid bath chairs), in a conspicuous position on the near (left) side of the vehicle." The rest of the announcement is an endeavour to explain clearly the position in which the licence card holder is to be carried on a motor car.

Special Features.

FRAME CONSTRUCTION
WANTED—A CYCLE CAR TRIAL!
THROUGH THE 1920 TRIALS.

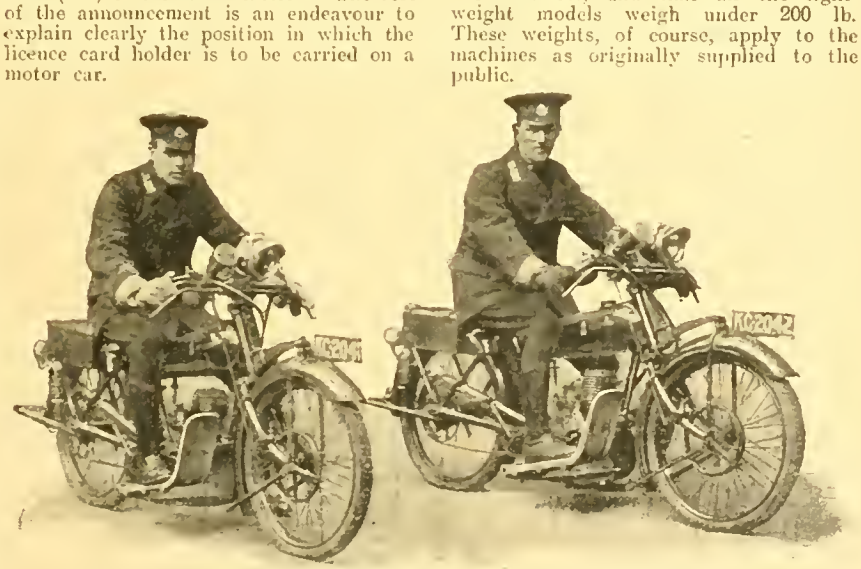
A Cycle Car Trial.

"Wanted—A Cycle Car Trial!" is the title of an article on this important subject on pages 51 and 52. Such a trial is highly desirable this year.

Return of Well-known Speedman.

S. L. Bailey (the Douglas exponent) is now on his way back from the Antipodes. This well-known record breaker is a native of Australia.

Wake up, England!



A Winnipeg (Canada) correspondent writes that there are only eight different makes from which motor cyclists in that city can choose, and that the only English make available is the Triumph.

New Companies.

Among new capital issues we observe Sidecar Taxis, Ltd., which has been registered at 137, Cox Street, Coventry, with a capital of £100 in £1 shares. Another new issue is Eric Williams, Ltd., at 1, Lowesmoor, Worcester, capital £5,000 in £1 shares. Also the British Motor Cycle and Cycle Car Research Association, registered as a company limited by guarantee.

F.N. Weights.

There are a large number of F.N. motor cycles of all dates in this country, therefore, in view of the new taxation, it is of interest to know that all four-cylinder machines of this make weigh over 200 lb., and that all the lightweight models weigh under 200 lb. These weights, of course, apply to the machines as originally supplied to the public.

MOTOR CYCLES FOR THE LIVERPOOL POLICE.

Although much behind the American police forces in the matter of motor cycle equipment, several British constabularies now use motor cycles in their many spheres of activity. These two Beardmore-Precisions have recently been supplied to the Liverpool police.

Permit for Cudham Hunt Refused.

The owner of Skid Hill Farm at Cudham informs a correspondent that he has refused a permit to the Woolwich (R.A.) Hounds for hunting over his lands, but has sanctioned a motor cycle meet and competition.

More T.T. Entries.

We understand that J. Blake and Co., of Liverpool, have entered an Ivy for the Junior T.T. It is also practically certain that there will be at least three Douglas machines in both the Junior and Senior races.

Second-hand Prices

Last week "Tax paid," a phrase which will become increasingly common, made its first appearance in our classified small advertisement pages; and it should be remembered that where this is the case the selling price of a machine automatically increases by 30s. to 80s. Little change is apparent, from the following table, in the general trend of the market.

Name, Model, and Date of Machine.	Lowest and Highest Prices.
A.B.C.	£115–£150
A.J.S., 6 h.p., sidecar, 1920	£180–£250
Allon, 2¾ h.p., 1920	£65–£85
Ariel, 6-7 h.p., sidecar, 1920	£120–£162
Blackburne, 4 h.p., sidecar, 1920	£120–£150
B.S.A., 4¼ h.p., sidecar, 1920	£110–£155
B.S.A., 4¼ h.p., solo, 1920	£100–£100
Clyno, 5-6 h.p., sidecar, 1916-17	£85–£120
Clyno-Jap, 8 h.p., sidecar	£140–£140
Connaught, 2½ h.p., 1920	£52–£62
Coulson-B., 4 h.p., 1920	£80–£110
Diamond-Jap, 2¾ h.p., 1920	£50–£65
Douglas, 4 h.p., sidecar, 1920	£125–£165
Douglas, 2¾ h.p., 1917-18	£45–£54
Douglas, 2¾ h.p.	£60–£115
Enfield, 8 h.p., sidecar, 1920	£140–£160
Harley-Davidson, 7-9 h.p., sidecar, 1920	£150–£210
Harley-Davidson, 7-9 h.p., sidecar, 1919	£110–£195
Henderson, 10 h.p., sidecar, 1920	£150–£157
Indian, 7-9 h.p., sidecar, 1919	£135–£175
Indian, 7-9 h.p., sidecar, 1920	£145–£175
Lea-Francis, 3½ h.p., 1920	£120–£130
Levis, 2¾ h.p., 1920	£50–£55
Matchless, 8 h.p., sidecar, 1920	£160–£185
N.U.T., 3½ h.p., 1920	£120–£125
Omega, 2¾ h.p., 1920	£65–£75
P. & M., 3½ h.p., solo, 1920	£87–£100
P. & M., 3½ h.p., sidecar, 1919-20	£85–£170
Quadrant, 4½ h.p., sidecar, 1920	£90–£130
Rover, 3½ h.p., single gear, 1920	£95–£115
Rover, 3½ h.p., sidecar, 1920	£155–£180
Royal Ruby, 3 h.p., 1920	£100–£120
Rudge, 3½ h.p., 1920	£77–£100
Scott, 3½ h.p., sidecar, 1920	£140–£150
Scott, 3½ h.p., solo, 1920	£105–£120
Sunbeam, 3½ h.p., sidecar, 1920	£170–£185
Sunbeam, 3½ h.p., solo, 1920	£140–£157
Sunbeam, 8 h.p., sidecar, 1919	£180–£215
Triumph, 4 h.p., sidecar, 1920	£145–£175
Triumph, 4 h.p., sidecar, 1919	£105–£135
Triumph, 4 h.p., solo, 1920	£100–£117
Triumph, 4 h.p., solo, 1919	£85–£105
Wooler, 2¾ h.p., 1920	£70–£82
Zenith, 8 h.p., sidecar, 1920	£145–£204
Zenith, 8 h.p., 1920	£120–£145
Zenith, 6-8 h.p., 1919	£85–£90

Imports and Exports.

1920 has been a very successful year for the British motor cycle trade, and despite a tendency towards slackness at the close the total value of our exports for the year has increased to £2,340,557, considerably more than the corresponding figure in 1919. Imports, over the same period, however, have increased in an even greater ratio; but it is noteworthy that the total value of our exports still remains nearly six times the total amount of our imports. The British motor cycle industry is certainly doing more than its share to maintain the balance of trade. Comparative tables for the year follow:

IMPORTS.

Total value of motor cycles and parts imported during 1919	£107,572
Total value of motor cycles and parts imported during 1920	£407,429
Increase	£299,857

EXPORTS.

Total value of motor cycles and parts exported during 1919	£899,177
Total value of motor cycles and parts exported during 1920	£2,340,557
Increase	£1,441,380

Examination of the Board of Trade returns for the month of December only (given in tabular form below) reveals the fact that our imports for that month show a decided increase compared with the corresponding period last year. Comparative export figures for the same dates, however, illustrate an equally decided increase—together a state of affairs which will benefit the Exchequer.

IMPORTS.

	Dec., 1913.	Dec., 1919.	Dec., 1920.
Number of motor cycles	155	679	106
Value of machines and parts ...	£17,835	£39,186	£16,820

BRITISH EXPORTS.

	Dec., 1913.	Dec., 1919.	Dec., 1920.
Number of motor cycles	1,305	885	1,193
Value of motor cycles only ...	£57,533	£62,884	£99,707
Value of parts and accessories ...	£21,874	£28,029	£50,911
Total value ...	£79,407	£90,913	£150,618

The Motor Cycle Grand Prix.

It has now been definitely decided that the Grand Prix of the Automobile Club of France will be held on the Circuit de la Sarthe on July 23rd. The course is close to Le Mans, 516 kilometres long, and, in the case of the car race, will be covered thirty times, each lap being 17 kilometres 200 metres in extent.

It is also settled that the Union Motocycliste de France will run a motor cycle race over the same course. The race will be about 300 miles in length. Very probably it will take place on Friday, July 22nd.

The Amsterdam Show.

No fewer than thirty-six makes of British motor cycles are exhibited at the Amsterdam Show, which opened on Friday last. In addition, there are eight exhibits of U.S.A. mounts and eleven hailing from the Continent.

Enterprise.

Motor cyclists are never slow to take advantage of a sporting offer. Recently Messrs. Maude's Motor Mart announced that they would award valuable prizes to mail order customers whose letters were opened first on a stated date.

The selection of the letters was accomplished in our presence by Mr. O. E. Seyd, who is in charge of the A.C.U. Publicity Department. Mr. Seyd, blindfolded, plunged his hand into the enormous heap of letters lying on the floor of the office and drew out one, written by Mr. C. Ridsdale, Fellthorpe, Great Driffield, Yorkshire, who had ordered a licence card holder. This lucky reader obtains a brand new 4 h.p. Verus-Blackburne motor cycle valued £126.

The same procedure was followed in the case of the second and third, Mr. E. Robinson, 46, Ella Road, West Bridgford, Notts, who had ordered a W.D., K.L.G. plug value 1s. 9d., and Mr. W. T. H. Bolt, 7, Ruskin Walk, Herne Hill, London, S.E., who had ordered a Dumbel spanner. Each of these gentlemen has now received an Autoped scooter.

At the last moment, Mr. Geo. Pettyt, manager of Messrs. Maude's Motor Mart, stated that he would offer five consolation prizes consisting of credit notes of £5, allowing anyone to order goods up to the value of this sum from the firm. The representative of *The Motor Cycle* was requested to make the selection, and the five letters were written by the Rev. J. E. Howell, St. George's, Shemhall Street, Walthamstow; F. H. Whiting, Whiting's Garage, High Street, Keynsham, Som.; Allan Palmer, Washington Street, Workington, Cumberland; T. H. Gosling, School Lane, Mareham-le-Fen, Boston, Lincs.; and H. H. Reed, Behind Berry, Somerton, Som.

A further gift of a motor cycle and scooters to the writers of the first three letters opened on the morning of January 24th will be made, and there will be also five consolation prizes value five guineas. A separate competition will be held by Maudes' Exeter depot.

A SCOTTISH WINTER TRIAL.

FOR this event of the Glasgow Western M.C.C., held on Monday last week, an entry of thirty was received. The course was a straight out and home run—Glasgow to Perth and back—and as the regulations were not too severe (there was only one secret check) the run was very much of a holiday nature.

The morning broke very dull, but the sun breaking through later, the outwards journey was taken under ideal overhead conditions. Of the roads, however, the least said the better. They were heavy and full of pot-holes, and the riders found driving anything but a picnic, and all were grateful for the few minutes to spare at the Stirling check.

After a seasonable lunch at the "Royal George," of happy memory to competitors in the Scottish Six Days, the return journey to Glasgow was started at 4 p.m. Lamps were soon lit, and many hoped for a most pleasant run to the city on the Clyde. Their hopes were, however, not fulfilled, and from Auchterarder to the finish very heavy rain completely spoilt an otherwise quite enjoyable outing.

We have seldom experienced a more miserable finish to an event, and it was no wonder that, with lamp and minor mechanical troubles, only nine riders checked in to time at the finish. Sidecar outfits predominated in the entries, and their drivers had a much happier lot than the solo riders on the flooded roads.

Not one solo machine completed the double journey. The successful nine (which includes two cycle cars) were as follows: Mrs. Duncan Bell (7 A.J.S. sc.), Mrs. W. Simpson (6 A.J.S. sc.), J. Littlewood (6 A.J.S. sc.), B. Brown (6 A.J.S. sc.), Duncan Bell (6 A.J.S. sc.), D. Alexander (8 Enfield sc.), J. Baker (8 Acme sc.), A. MacEwan (8 Richardson), and J. Bell (10 G.N.).

WANTED—A CYCLE CAR TRIAL!

A Plea that Three and Four-wheeled Cycle Cars be Allowed to Compete Together.

By B. H. DAVIES

Following is a résumé of the present position of the cycle car movement. Our contributor supports the oft-expressed plea of "The Motor Cycle"—that light four-wheeled cycle cars be developed side by side with the machines to which they form an alternative (i.e., the sidecar and the runabout).

We reiterate that a sound cycle car definition is urgently needed. Such a definition, to be effective without unduly tying the hands of the designer, should not include the number of wheels as a factor; on the other hand, it is highly desirable that the following essential points be covered.

Weight: which should be not more than 8 cwt.
Engine capacity: not to exceed 1,100 c.c.

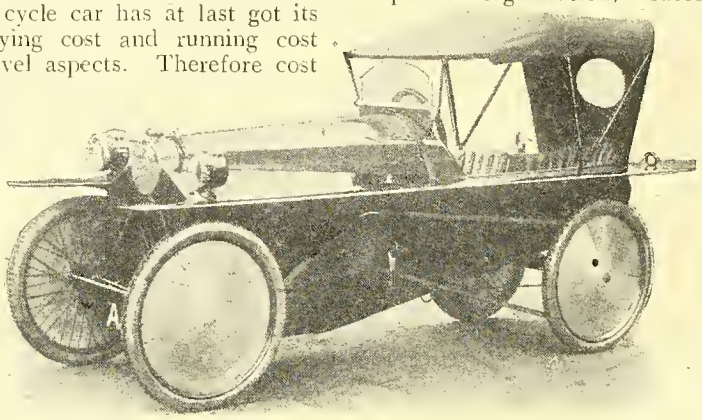
ENERGETIC development of the cycle car is perhaps the most crying need for the 1921 competition season. In pre-war days it was quite unusual for a man to remain faithful to the cycle car. He bought one because his income at last justified a more ambitious vehicle than a motor cycle, and did not as yet run to a car. He probably sold his first cycle car at the end of its first season, because he now saw his way to ordering a car, or because his business had not prospered, and a relapse to the motor cycle became prudent. Thus few users lasted long enough to become enthusiasts, and a market so limited and fluctuating did not tend to build up a stable industry. The root trouble was that the best sidecar outfits cost £150, and that a brand-new light car of the best-class could be bought for £25 more. Under such conditions the cycle car had about as much chance of making good as an Italian ice cream vendor in the Antarctic.

1921 has transformed the situation. Up to £250 is now charged for a first-rate sidecar outfit *de luxe*; but, on the other hand, the average light car is listed at round about £500. It is hardly likely that the space between these two boundary lines will be narrowed appreciably. If car prices sink, motor cycle prices will sink for similar reason. The cycle car is assured room to stretch its wings. Already there are signs that the existing price gap will be filled by an infinite variety of light passenger vehicles, all displaying affinities more or less pronounced with motor cycles on the one hand and motor cars on the other. The two extremes may be illustrated at the moment by the Carden cycle car, which has a very simple engine, and sells at a motor cycle price (£100); and the sporting A.B.C. car, which is a car in every item of its specification except the engine (an air-cooled flat twin). Between the price extremes of these two types a bewildering selection of hybrid machines are already on offer, including at least six different makes of three-wheeler, and at least one popular "car," the 8 h.p. Rover, the makers of which employ a night-shift even in these hard times.

The attitude of the general public towards the majority of these hybrid vehicles is one of good natured suspicion. The G.N., the Morgan, and the G.W.K. have already proved themselves in competition. The Rover won its early orders on the strength of the Rover reputation, and is now selling by the recommendation of private owners. The A.B.C. got its start in life, thanks to Mr. Bradshaw's name. Few of the other cycle cars have any asset of a kind which appeals to the man in the street; and money is now so tight that adventurous extravagance is over; nobody will any longer "chance" a purchase, as thousands did in the motor famine of 1919-1921. In the meantime a host of potential cycle carists are waiting eagerly for a lead. They will buy cycle cars as soon as they are given the necessary information for sorting out the good specimens from the duds (if any). They will *not* buy till they get this information. Until such information is forthcoming, would-be owners will remain motorless, and thousands of artisans will be kept unemployed. (As a proof of this, the 8 h.p. Rover has already caused many people to become motorists who had no such intentions until they saw this little car, and heard good accounts of it.)

A little cycle car on approved car lines—the French shaft-driven Peugeot quadrilette, which has a 667 c.c. water-cooled four-cylinder engine much smaller in capacity than the majority of twin sidecar outfits.

An Urgent Need.



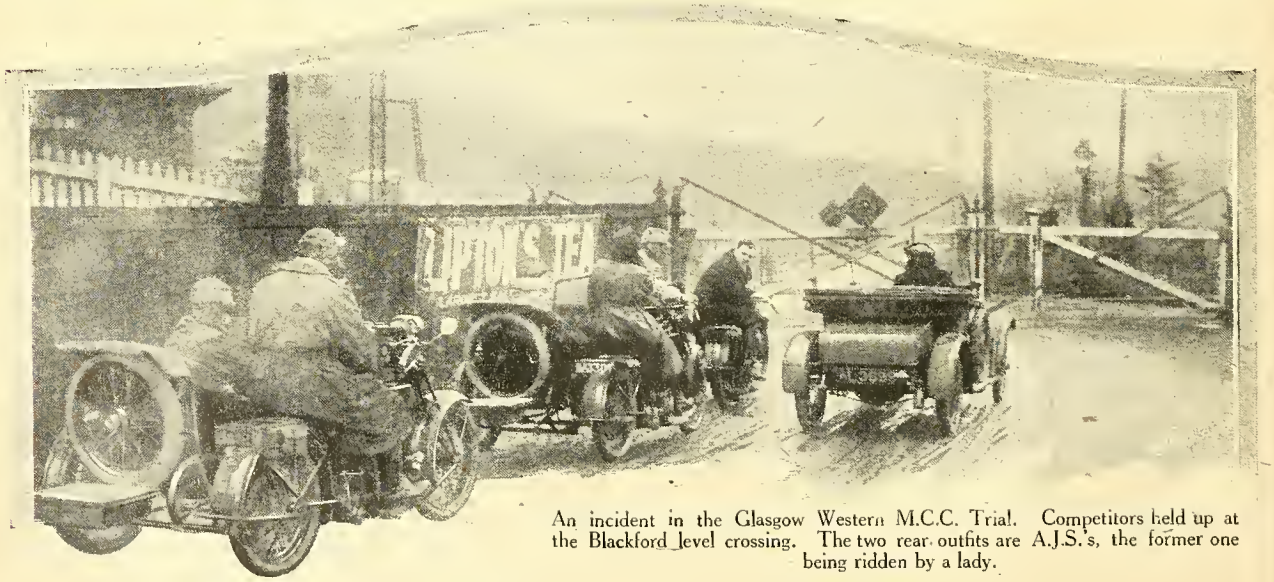
A Six Days Cycle Car Trial is urgently needed by the public, by the manufacturers, and by the men of those unions which supply the motor industry with its labour.

At once the difficulty arises—who is to organise such a trial? At the present moment three-wheeled cycle cars are "controlled" by the A.C.U., and four-wheeled by the R.A.C. Two separate events are quite impracticable. There are not enough makes of three-wheeler runabouts to con-

Wanted—a Cycle Car Trial!—

stitute an imposing trial. If the R.A.C. attempted to include four-wheeled cycle cars in an event to which light cars were admitted, the more expensive and refined machines would overshadow the genuine cycle car, just as the plucky little 7 h.p. twin-cylinder Swift was blanketed in the 1914 light car trial.

Great care will be needed to prevent the three-wheelers from being overshadowed by the four-wheelers in a combined trial. But the trial *must* be of the "combined" type because COST is the vital factor throughout. The cycle car has at last got its opportunity, because buying cost and running cost have assumed entirely novel aspects. Therefore cost and weight, and not the number of wheels, are the principles of identification. But we do not yet know whether the man with £250 or £300 to spend would be better advised to buy a four-wheeler or a three-wheeler. It follows that the trial should include all the three-wheelers, and some of these four-wheelers which in price and specification have more affinities with the motor cycle than with the motor car.



A cycle car which may be said to be a re-arranged motor cycle—the popular little Tamplin.

Before such a trial can be held, a regrouping of the control is indispensable; and the body which ultimately undertakes the responsibility will have to decide the basis of admission most carefully.

The organisers might be: (1) the A.C.U., (2) the R.A.C., or (3) a mixed committee, to which the A.C.U. and R.A.C. might delegate the job with careful instructions.

Few cycle car enthusiasts will regard the R.A.C. as the ideal management. The R.A.C. contains members who know a great deal about cycle cars and care a good deal for them. But there is no guarantee that these members would be entrusted with the work. Some of the leading cycle car experts and enthusiasts are not members of the A.C.U. On the other hand, the A.C.U. gave the G.W.K. and the Morgan their best chances of publicity. If a mixed committee cannot be arranged, the A.C.U. is the best alternative; for nobody else has ever cherished the cycle car, if we except a little rather casual assistance from Brooklands, the J.C.C., the M.C.C., and the Edinburgh M.C.C.

Some ardent spirits will doubtless claim that a special organisation, based on and corresponding to the Junior Car Club, should immediately take over this urgent task. This might prove to be a good solution. There are two objections to it. The first is that the Junior Car Club is not—as yet—a national organisation. It may grow into one; but at present its position is rather analogous to that of the M.C.C., except that it has less experience of running big trials. The second is that the future of the cycle car is at present extremely vague. Which type prophesies the predominant vehicle of to-morrow? The Tamplin, the G.N., the Morgan, the Rover, or another? Or will there always be room for them all? If we stereotype definitions and organisations too rigidly to-day, we may have to recast them to-morrow; and the history of motoring organisations contains sad evidence of the fashion in which clubs cling to any prestige which they have attained, even at the cost of dividing our energies, hampering our development, and weakening our forces. I am all in favour of rather tentative and provisional treatment for the cycle car at present. A joint committee, nominated from the A.C.U. and the R.A.C., would best meet the emergency.

An incident in the Glasgow Western M.C.C. Trial. Competitors held up at the Blackford level crossing. The two rear outfits are A.J.S.'s, the former one being ridden by a lady.

Widnes M.C.

The above club is holding its annual meeting and dinner to-day.

Surbiton and District M.C.C.

Surbiton and District M.C.C. have chosen the date of May 28th, for their inter-club team trial for Maudes' Challenge Shield. It is hoped that any clashing of events will be avoided by this early notice.

Bristol M.C.C.

As the "hares" were not caught in the Boxing Day trial, briefly reported last week, the results (now to hand) were decided on a 20 m.p.h. schedule. There were four prizes, as follows: 1, V. Courtney (3½ Sunbeam); 2, W. Le Brun (3½ Rudge sc.); 3, G. F. Tozer (2¾ O.K.); and 4, Rex Foweraker (3½ Sunbeam sc.).

North Wales M.C.C.

The first annual dinner and distribution of prizes will take place at the Bull Hotel, Denbigh, on January 18th. The chair will be taken by Mr. William Edwards, the president. All are cordially invited. Tickets, 5s. each, are obtainable from the secretary, 1, Ruthin Road, Denbigh.

Bucks County M.C.C.

At the annual meeting of the High Wycombe and District Motor Cycle Club, held at headquarters, the question was thoroughly discussed with regard to forming a county club, and it was, in consequence, resolved to alter the name of the club to the Bucks County Motor Cycling Club, as it was thought that it would give a much larger scope to motor cycling in the county.

The hon. sec., Mr. W. F. Johnson, 17, Priory Avenue, High Wycombe, Bucks, will be pleased to supply any information to motor cyclists desirous of joining the club.

North West London M.C.C.

The Reliability Trial held on New Year's Day over a circular course, including the well-known hills in the Chilterns, proved one of some severity under the appalling weather conditions prevailing. There were several mechanical failures in the earlier part of the course, but otherwise competitors arrived to time up to lunch.

After lunch, Kop Hill, which, with Pink Hill, was on the non-stop section, proved too much for several.

In the end the special cup for best motor cyclist's performance would appear to be safe in the hands of Hal Hill (7 Zenith), with P. G. Averill (6 A.J.S. sc.) second.

Wallington and District M.C. and L.C.C.

The club will held a fancy dress dance at the Parish Hall, Wallington, on February 19th, 1921, at 7.30 o'clock. Tickets, which are 6s. 6d. single and 12s. double, may be obtained from the secretary, Mr. C. M. Bowen, The Chalet, Woodcote Avenue, Wallington, Surrey.

Western Centre A.C.U.

Entry forms and particulars of the Western Centre A.C.U. Open Reliability Trial will be available shortly from the honorary trials secretary, "St. Moritz," Wyche Road, Malvern. The regulations have been so framed that the private owner should have an equal chance with the trade rider to gain highest honours.

New Tredegar and District M.C.C.

The first annual dinner of the above club was held on December 30th, 1920, when a large number of motor cyclists accompanied by their lady friends, gathered together for the final meet of the year. Invitations were given to prospective members, of which many appeared. The dinner was carried out with great success, everyone being highly pleased with the arrangements made. Following the dinner was a concert, over which Mr. J. Cordingley presided.

The Public Schools M.C.C.

The first annual dinner since the war will be held at the Café Royal, Regent Street, on Thursday, January 27th. The dinner will be 15s. 6d., exclusive of wine. Members are invited to bring friends who are likely to join the club. Prizes will be distributed after dinner and the annual general meeting will be held after the speeches. The president of the club, Colonel F. Lindsay Lloyd, C.M.G., will occupy the chair. Secretary, H. B. Browning, 2, Morpeth Mansions, Victoria, London, S.W.1.

Dublin and District M.C.C.

The Dublin and District M.C.C. held a winter reliability trial over an exceedingly stiff course on the Christmas Bank Holiday. Though only sixty miles in length, it embraced all the well-known South Co. Dublin and North Wicklow test hills.

The following eleven, made up of three sidecar outfits and eight solos, completed the course approximately on time: T. E. Green (6 Enfield sc.), H. McAllister (6 A.J.S. sc.), D. Allen (4 Norton sc.), Maj. J. Waters (2¾ Velocette), J. A. Carville (4 Triumph), P. H. Hurse (4 B.S.A.), R. Humphreys (2¾ Velocette), J. McTaggart (7-9 Indian), A. Carton (4 Indian Scout), and P. McGrath (2¾ Velocette).

Taunton and District M.C.C.

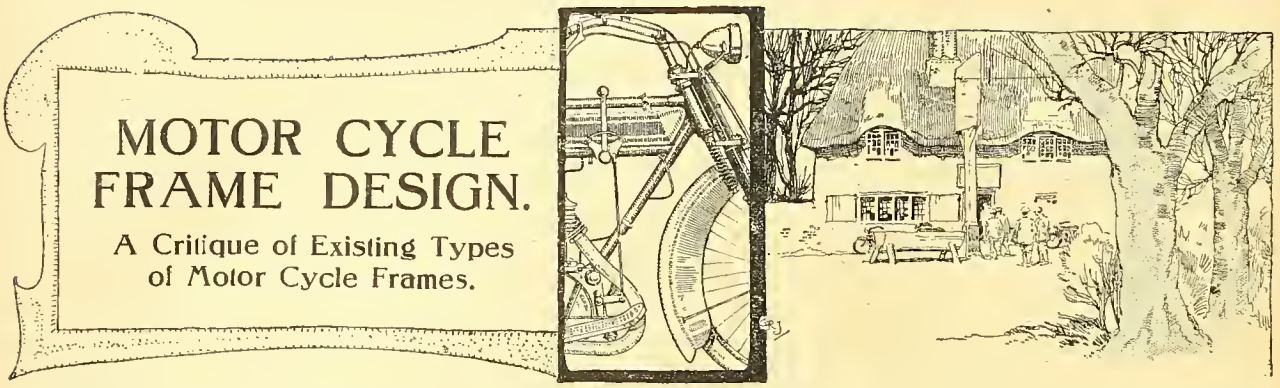
The Taunton and District M.C.C. are holding their annual general meeting at 6.30 p.m., on Thursday, January 13th, at the Castle Hotel, Taunton, to be followed by a dinner and concert.

Loughborough and District M.C.C.

The above club is holding a whist drive in the Corn Exchange, Town Hall, on Tuesday, January 18th. Tickets, 2s. 6d. (including refreshments), may be had from the hon. sec., 64, Frederick Street, Loughborough.

Ealing and District M.C.C.

This club will hold a cinema show and dance on January 24th at 8 p.m. A hearty welcome is extended to all motor cyclists. Tickets, price 5s. 6d., can be obtained from Mr. F. A. Longman, 17, Bond Street, Ealing, London, W., and Mr. F. H. Douglas, 100, Great Portland Street, London, W.1.



The Motor Cycling Club.

The M.C.C. annual general meeting will take place at Pagani's Restaurant on Wednesday, January 26th, at 7 p.m. Members who have the interests of the club at heart are requested to attend this meeting. It is hoped that the opening on Saturday, March 12th, will be to Brighton, as usual.

Sheffield and Hallamshire M.C.C.

A Boxing Day trial for the Stewart trophy was held over a main road route from Sheffield, *via* Rotherham, Doncaster, York, Malton, to Scarborough. After lunch the return journey was made over the same route. Fine weather prevailed during the whole day, but the competitors encountered very severe conditions, having to contend with bad roads, pot-holes, inches of mud, and, on the outward run, a strong head wind. These severe conditions caused a good few retirements *en route*, but, despite all this, two competitors ran through all known and secret checks without the loss of a single point. Another very fine performance was made by E. Sneath, who piloted a 2¾ h.p. Wilkin and sidecar over the whole course, and duly checked in at the finish. The results were as follows:

Stewart trophy and replica each, E. A. Wheatley (4 Triumph) and S. Sawer (4 Norton sc.) tied for first place; 2, W. Kantlehem (3½ Wilkin sc.); 3, E. Cross (6 A.J.S. sc.). Club silver spoons for finishing within a specified time: G. Fletcher, W. G. Brown, E. Searle, and E. Sneath. The last named was presented with a special prize by a member for the most meritorious performance on a sidecar machine.

MOTOR CYCLE FRAME DESIGN.

A Critique of Existing Types of Motor Cycle Frames.

THERE are few parts of the modern motor cycle which need, or are capable of, such drastic alteration as the frame. It is true that present day frames do not often give trouble under normal conditions, but their success is achieved by unnecessary weight rather than by scientific construction. With this in mind, the paper read by Mr. Douglas Leechman before the Institution of Automobile Engineers on December 30th is of especial interest. After giving a brief history of the cycle and motor cycle frame from the earliest days, and explaining how existing defects came into general use, the author attacked the actual problem, and we publish extracts from his valuable lecture.

The Problem.

Primarily, the designing of a motor bicycle frame is a bridge proposition. The simplest form of frame would consist of a single beam supported upon the axles of the two wheels (fig. 2).

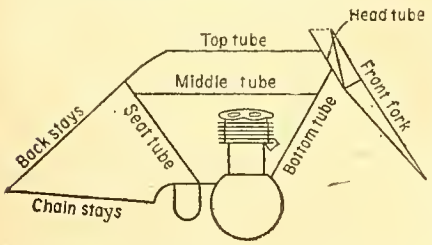


Fig. 1.

In addition to the ordinary function of a bridge of carrying a load over a gap, the motor bicycle frame (apart from anti-vibratory and transmission adjustment considerations) must be capable of resisting longitudinal, tensile, and compressive stresses set up by forces tending to vary the distance between the wheel centres, and (apart from steering consideration) the frame must also be capable of resisting forces tending to deflect the wheels from the longitudinal vertical plane about vertical or horizontal axes or a combination of both.

As the principal part of the load, namely, the rider, is to be carried at a certain height, the beam may be made of such a depth that the top of it will reach up to the saddle, less a few inches for adjustment and spring motion. Behind this point the beams may be tapered off to the rear axle, to economise material and reduce weight. Were it not for steering considerations, the beam would be similarly tapered off right from the saddle towards the front axle, leaving an ideal form deepest where the concentrated load is applied, and reducing regularly in depth as the bending moment decreases. (See dotted lines in fig. 2.)

Fig. 2.

Here we are met with one of our most serious problems. The best kind of steering demands that a large gap shall be cut upwards in the front part of the beam to allow for the deflection of the steering wheel when the bicycle is describing curves, fig. 3. Incidentally, it also allows of a certain amount of tapering at the extreme front end of the beam.

In this connection we have to remember that while the strength of a beam varies directly as its breadth and inversely as its span, it varies as the square of its depth. Thus, a cut only half way up from the under (tensional) side reduces the strength of a beam to one quarter of what it is in its complete form. The demand for such a deep gap as is required by the steering is calculated to make the ordinary bridge engineer gasp. The importance of leaving the uncut section at A as deep as possible and of even inclining the upper surface of the beam towards the front in order to increase the effective depth at this point is surely sufficiently glaring, and yet "awful examples" are not lacking in which the designer has actually gone out of his way to carry the gapping to extremities by reducing the section at the head to practically a point. Such designers are fortunately few, but there are many who fail to give practical recognition to the fact that the stresses on the head bearing are in inverse proportion to the distance between the two rings of balls.

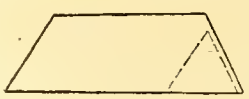

Fig. 3.

Plane Figures.

In any skeleton structure of more than three sides, and not triangulated by diagonal bracing, the permanence of the form depends primarily upon the resistance which the joints are able to offer to distortion, provided that the load is applied at one of the angles. For example, take a tube and lug rectangle, such as ABCD, fig. 4. If forces be applied at A and C, as indicated by the arrows, the points of intersection of the axes of the tubes at B and D may be regarded as fulcra, and the full leverage will be expended on the lugs, tending to close B and D and to open A and C. If the lugs be strong enough to resist the force, the portions of the tubes just clear of the lugs will be called upon to resist the bending moment, and if these be enabled to resist the force by means of suitable butting or liners, the force will be expended on the plain and middle portions of the tubes. While the leverage is greatest at the lugs, it is least at the middle sections of the tubes, and in an ideal construction of this kind the strength would be perfectly graded all along from the ends to the centres, in proportion to the leverage. Such structure would resist any stress (up to the elastic limit) without fracture or even permanent set, and would spring back to the original form when the load was removed.

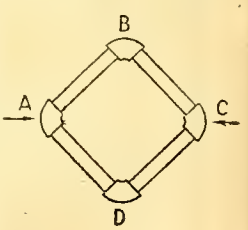

Fig. 4.

In an open polygonal motor bicycle frame, the stresses on the joints differ little if at all from those generally characterising such figures, and the strength necessary to safety can only be secured with a weight greatly in excess of that easily attainable with a correctly trussed frame.

Requirements.

The frame members must be arranged not as an open quadrilateral or polygon, but as an assembly of triangles, so that the whole constitutes a single trussed beam. The load or loads must be applied at the angles, that is, at the joints, and not on and transversely to any of the sides.

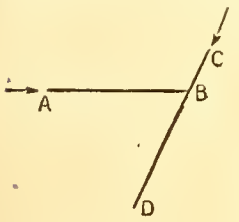
Two triangles must not be connected only by one angle of each.

The plane of the beam must be arranged in the plane of the load.

Let us examine the standard type of frame in the light of these principles. First, we observe that it is not an

Motor Cycle Frame Design.—assembly of triangles only, but, apart from the front fork, comprises a triangle, a quadrilateral, and a polygon—all of doubtful lineage. Breaking the first law leads to infraction of the second. The fourth law is very fairly complied with, so far as solo machines are concerned.

The essential wrongness of arranging one load-carrying tube to bear on or be joined to another at an intermediate point on the latter may be shown as follows: Let the first tube AB (fig. 5) be joined to the second CD at B. Two forces AB and CD are acting on the point B. Whether the values of those forces be proportioned to AB and C*b*, or whether they have any other practical value, it is evident that their resultant cannot be in the direction BD; that would be to assume that the value of the force AB was zero. Hence, the arrangement AB, C*d* involves a transverse stress on CD, which will shear after the force has been applied a greater or less number of times.



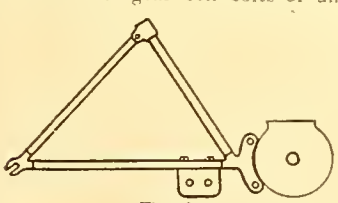


Fig. 5.

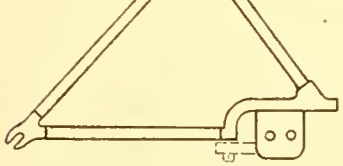
The Rear Triangle.



Referring now to the rear triangle, a heavy casting is often found at the junction of the seat tube and back stays—and a heavy casting spells bad design. The casting is mainly horizontal, and its forward end extends to the engine, see fig. 6. The gear box is suspended from this casting by bolts passing up through holes in the casting, the holes being slotted to allow of adjustment of the front chain. The countershaft thus lies some inches below its point of support, and the stresses on the bolts are much more severe than they either should or need be. Seeing that the tension set up in the chains by the transmission of the driving force tends to draw the gear box towards the crankshaft in the one direction and towards the axle of the driving wheel in the other direction, it follows that the struts between the engine and gear box should lie in the plane of the crankshaft and countershaft, and that the struts between the gear box and back axle should lie in the plane of that axle and the countershaft.

Correct design of these parts would not only relieve the gear box bolts of undue

Fig. 6.

transverse stresses, and the chain stays of a wasteful tendency to bow upwards, it would also offer direct resistance to any tendency the gear box may evince to twisting out of parallel with the driving wheel axle while, say, hill-climbing. Some machines exhibit a sort of mute acknowledgment of these principles, the rear end of the casting being curved down so that the chain stay tubes actually lie in the plane of the driving wheel and the gear box axles, fig. 7, but as the forward ends of the tubes do not reach the gear box by some inches, little benefit is derived from the arrangement. A substantial improvement would be secured by providing the back of the gear box with lugs which would extend to and overlap the forward ends of the chain stays themselves, and be bolted thereto in a way which would allow for the necessary adjustment. The author would suggest that the chain stays should be duplicated, the upper pair running from the rear fork-ends to the top of the crank case, and the lower pair from the fork ends to the bottom of the crank case or to a part of the frame adjacent thereto, see fig. 8. The stays would thus act as torque tubes to the engine. The gear box would lie between the pairs of stays which would be provided with parallel upper and lower beds on which the box would be mounted adjustably. Or the box could be hinged to one pair on a transverse axis and locked, after adjustment, to the other pair. In either case, the gear box would form the third side of a triangle to both pairs of stays.

The equivalent lesson in pedal bicycle construction, namely, the direct staying of the bottom bracket, was learnt thirty

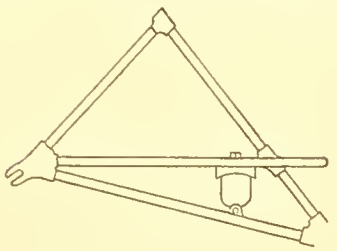


Fig. 7.

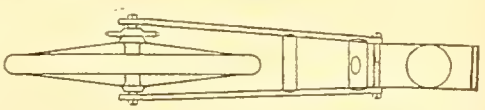
years ago, and yet it seems to have been lost on the motor cycle designers of to-day.

As already indicated, bending of the chain stays and seat stays should be avoided as far as possible. They should be straight in rear elevation and in plan as well as in side elevation. This may involve a longer back axle, but that is almost wholly an improvement, as it means a wider hub and stronger wheel; and it also gives the opportunity, which should not be missed, of bringing the sprocket or the belt rim, as the case may be, between the ball races of the wheel bearing, see fig. 9.

The Polygon.

Unfortunately, the great majority of motor bicycles to-day embody an aggravated instance of the application of a transverse stress to a tube in the arrangement of the middle tube. The result is that when the front wheel encounters an obstacle, the head tube endeavours to rotate backward about a transverse axis drawn through, say, the top head bearing. As the bottom of the head tries to go back, the upper end of the bottom tube tries to swing back, too, but the tendency is resisted more or less completely by the middle tube, which in effect delivers a sharp kick to the bottom tube every time it attempts to stir. This kind of action can only be repeated a limited number of times before fracture ensues. To guard against it we find a ponderous casting, comprising the whole of the head and often extending along the down tube to below the joint with the middle tube. If the casting is massive enough to preclude the occurrence of either of these failures, the defect exhibits itself elsewhere, as,

Fig. 8.



for example, by breaking the seat tube where the rear end of the middle tube is joined to it, or the top tube (particularly if curved) behind the head lug.

Provided that the top tube is neither curved nor kinked, the polygon can be converted into a triangle by the simple expedient of raising the middle tube until it reaches from the saddle-pillar lug at one end to the bottom of the head at the other.

The Quadrilateral.

To describe the lower panel of the main frame as a quadrilateral is a euphemism, but the term will serve in place of something which could only be more veracious by being less polite. Three of the sides are constituted by the middle tube and portions of the seat tube and bottom tube; the fourth side is constituted by the engine in a manner which the author believes, and hopes, is unique in constructional engineering.

It is admitted that the crank case, owing to its hollow cylindrical formation, is in itself a very strong article, and is unlikely to give trouble as a member of the frame. To that extent it may be well adapted to act as, say, a king-post, the function which it performs in the Scott frame. But that is not all. The engine is no inert mass, but a powerful generator, struggling at every explosion to rotate backwards around its crankshaft, and wrenching some thousands of times a minute at the fixings which attempt to retain it in place. A body of such an active nature is essentially unsuited to form one of the elements of a frame, the functions of which are characteristically those of a passive resister.

Fig. 9.

Roll.

The engineer, on first dealing with the subject of bicycle frame design, is apt to disregard the possibility of roll. He imagines, perhaps not unnaturally, that as the bicycle is a balanced vehicle there are no material forces acting on the frame other than those of which the directions

Motor Cycle Frame Design.—

are in the plane of the frame. As practical riders, we know that, even when riding along a straight road, a frame which is weak torsionally will exhibit an unsteadiness which may be not only uncomfortable but actually dangerous. This weakness may arise to some extent from the front fork being indirect in form, or constructed of too light members, or to it being flimsily connected to the spindle.

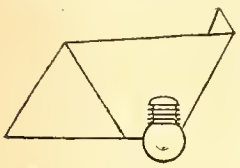


Fig. 10.

The main rolling action appears to take place, however, about an axis coincident with a line extending from the bottom of the head to the point of contact between the rear wheel and the ground. It may be due to too short a head, to a reduction of the depth of the frame section behind the head (fig. 10), to the use of tubes which are too small in diameter or in gauge, or which are bent instead of straight.

In view of claims put forward on behalf of pressed steel for motor bicycle frame construction, it may be of value to note that a steel tube of a given size is as efficient when functioning as a long strut as a mild steel channel section of rather more than five times the weight.

By way of practical summary, a design of motor bicycle frame is submitted in

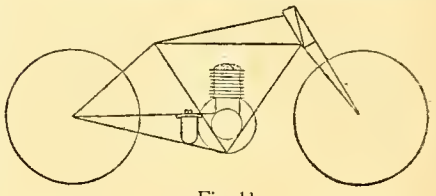

Fig. 11.

fig. 11, which, without any claim to perfection, may be considered as avoiding most of the defects above referred to, and as according with the elementary principles of a tubular structure.

LONDON-EXETER RESULTS.

THE results of the M.C.C. Boxing Night run to Exeter and back to London on December 28th, 1920, have now been passed by the committee of the Motor Cycling Club and are tabulated below.

It will be seen that the percentage of gold medallists to starters is greatest in the car class, while almost equal ratios obtain in the case of the solo, sidecar, and three-wheeled classes.

Probably the outstanding performance of the whole trial was the running of the 8 h.p. Matchless outfits. Of the nine which started eight secured gold medals, the remaining one qualifying for a silver. This excellent team work was closely approached by the Harley-Davidson riders with ten golds to one silver out of thirteen riders, and the Morgans with four golds and three silvers to the credit of seven starters.

ANALYSIS OF ENTRIES.

Class.	Entries.	Starters.	Finishers.	Gold.	Silver.	No Award.	Disqualified.	Held over.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

SELECTING A MACHINE.

[?] As you have so much experience of motor cycles, I take the liberty of asking if you would be good enough to give me information as to which is the best motor scooter on the market—not for racing but for all-round general use.—A.J.

It is not feasible to recommend any particular machine in preference to all others of the same type, since the products of the various makers have each their own special advantages. If you forward the names of any you select, together with particulars of the work you expect from them, we will endeavour to advise you on the suitability of your choice.

CAM OVERLAP.

[?] I have a 1916 2¾ h.p. Douglas W.D. model, and a friend a 1915 2¾ h.p. Douglas. Both machines run well on the whole, but the 1913 pulls far better at low speeds, especially when hill-climbing, though it is, and always has been, a slow machine. The 1916 is, for an untuned machine, really very fast, and will climb well, provided the revolutions are kept high enough. I am willing to sacrifice some speed in order to get better pulling at low speeds, and have been comparing the two machines to see how to accomplish this. My spark is set a little more advanced, but not enough to make any appreciable difference, but the valve timing is altogether different. I should be much obliged if you could let me know whether an alteration in the valve timing would give the desired result, and can I carry this out with the present cams, or should I have to write to the makers for new cams? I note you say in a recent number that a little overlap is allowed, but my engine has 35°, and surely this is rather much; the exhaust also is open for more than half the explosion stroke, and is still open after suction has commenced, while the exhaust of the 1913 engine is only open a few degrees before the bottom of the firing stroke. I have tried various jets in the carburetter, but all to no purpose. —T.A.M.

Apparently the 1916 machine was fitted with an overlap cam which is suitable for racing purposes. You would be able to obtain a cam similar to the one used on the 1913 model from the makers, and this would no doubt give you the results you desire. If you obtain the makers' instruction booklet you will find several diagrams showing the valve periods with the various cams which can be obtained, and you could then select the one which you think would be most suitable. For ordinary touring work, and especially for hill-climbing, the amount of overlap on your own machine appears excessive.

OIL RELEASE THROUGH ENGINE PULLEY

[?] I have a 1913 Triumph, which throws oil and smoke out of the pulley end of the crankshaft on to my boot. The hole in the shaft is quite clear. Although I oil the engine about one pumpful every four or five miles, I never see any smoke or vapour come out of the exhaust pipe, and am inclined to think the exhaust gases must pass the rings and get out *via* the crankshaft. The exhaust valve lifts all right, and I fitted new rings about two months ago. The compression is very good, and the engine pulls well, and will take sidecar (with passenger) almost anywhere.—R.D.

If the compression is good and the engine pulls well, as you say it does, it is rather unlikely that the exhaust gases are passing the piston rings to any great extent. Apparently you have over-oiled the engine, and you might try the effect of cutting down the supply to one pump in every six or eight miles. The blowing of oil vapour through the centre of the pulley is usual on this machine, especially if there is too much oil in the crank case. We should advise you to fix up some form of shield immediately opposite the end of the pulley. We once saw an old tablespoon adapted for the purpose.

A SIX-STROKE ENGINE.

[?] As I am desirous of turning a 1½ h.p. stationary petrol engine into a gas engine, will you please put me right on the following: (1.) It already has an American magneto fitted, but this is not very satisfactory, and for ease in starting and reliability I propose fitting a tube ignition. Shall I have to fit some kind of cut-out on one of the strokes of the engine so that the red hot tube is not protruding into combustion space during both strokes? (2.) An acquaintance, who thinks he knows quite a lot about the matter, tells me that some engines are made to fire on every third stroke. Somehow I cannot quite understand how he means to do it. Is this possible? Also would this system benefit the engine in any way as regards cooling and gas consumption?—A.B.

(1.) We should not advise you to convert the engine to tube ignition. If the present magneto is not a satisfactory one, try to obtain another of British manufacture. (2.) Probably your friend refers to an engine working on the six-stroke principle. In a gas engine fitted with extremely heavy flywheels this can be done: perfect scavenging and better cooling result.

This Excelsior taxi sidecar is already available for private hire in Glasgow, but an application for a hackney carriage licence is under consideration by its owner.

GEAR RATIOS AND IGNITION TIMING.

I have a Charter-Lea machine fitted with two-seater sidecar (8 h.p. J.A.P. engine). The weight of this outfit is 4¾ cwt. At present the machine is geared 4⅝ to 1 on top. Is this too high a gear? The weight of passengers being 24 stone, makes the total weight 7¾ cwt. If too high, what gear would you advise me to use? I am troubled with pre-ignition when driving on top. Binks carburretter, jets 00.2 and 6.—E.M.

Considering the weight of your outfit, the gear ratios are too high. You would get an improvement by lowering the top gear to 5 or 5½ to 1. Pre-ignition may be due to a variety of causes, the chief being excess of carbon deposit in the cylinder head, or an unsuitable type of sparking plug. In all probability the ignition is too far advanced to suit the present gear ratios, and the symptoms may disappear when the gear is lowered.

SINGLE-GEARED SIDECARING.

I have a 1912 3½ h.p. clutch model machine, the engine of which has just been thoroughly overhauled by the makers. I am anxious to fit a light sidecar for the summer months, but do not wish to go to the expense of fitting a change speed gear. The machine is not intended to tour the Lake District and such places. (1.) Do you think the machine powerful enough without fitting a two or three-speed gear? (2.) What type of sidecar do you advise? (3.) What gear ratio would you advise me to use? The adjustable pulley fitted to the machine will, of course, allow of suitable ratios for solo or sidecar work.—J.A.H.

(1.) The machine would be fairly satisfactory with a very light sidecar, but we strongly recommend that you fit some simple form of variable gear, such as the Philipson pulley; this does not in any way necessitate alteration of engine or frame. (2.) A lightweight sporting model would be best. (3.) If you intend using a single gear, about 5½ to 1 will be most satisfactory.

READERS' REPLIES.

EFFECT OF PROLONGED WEAR.

I have experienced the same trouble, of jerky running in the second gear of the Sturmey-Archer gear box, described by your correspondents, and I ultimately found that the defect was due to the dogs occasionally disengaging, not from any fault in the dogs, but due to wear at three points in the second speed locking device, viz.: The sides of the middle slot in the locking quadrant were too rounded; the point of the locking plunger was too flat and the sides of this last were a bad fit in its socket. By altering the shape of the second speed slot in the quadrant, and making a new plunger with a smaller included angle between the inclined sides, and also of a slightly larger diameter to suit the socket after reboring it to produce a round hole, I have had no further trouble.—C. C. LEACH.

I notice that "H.C." (issue of December 9th) and W. A. Bourne (December 23rd) have been troubled with "jumpiness" in second gear of W.D. Triumphs. They will probably be able to remedy this by fitting a new pair of gear connection pins (No. 3188 in the Triumph repairs and parts catalogue). A new short gear lever swivel (No. 3185) may also be required. Wear on these parts makes it impossible to keep the second gear in correct adjustment, and so causes snatch in the drive.—W. W. KILBY.

The "jumpiness" in second gear experienced by "H.C." and W. A. Bourne is evidently due to wear in the layshaft sliding pinion of the Sturmey-Archer gear. Wear of the internal dogs occurring, no amount of adjusting of the controls will do any good, and the best remedy is a new pinion—easily obtainable from the makers. If "H.C." and W. A. Bourne follow the above advice they will find the trouble disappear.—H. T. JACKSON.

M.C.C. London-Land's End Trial.

April 27th—
A.C.U. One-day Winter Trial for Stock Machines.

May 14th—
M.C.C. London-Edinburgh Run.

DEFECTIVE WORKING OF DRIP FEED.

"F.H.M.Y.'s" trouble referred on December 30th, 1920, namely, the presence of an excess of oil in the sight chamber of his drip feed lubricator, can only be caused by one of three things: *(a)* Defective non-return valve. *(b)* Unsound sight chamber. *(c)* Oil delivery pipe choked. *(c)* Is very unusual and would immediately be detected, because it would prevent the oil getting to the engine. This leaves *(a)* and *(b)*, and the fact that oil is splashed over the tank would indicate that there is a big leak in the sight cup. Seeing that the non-return valve has been replaced by a new one, we should be inclined to think that the trouble would cease if the sight cup were made sound, and this can be done by replacing the glass if cracked, and the washer if worn; if both these are already in order, then the top cap wants firmly screwing down to make an air-tight joint. The principles involved in the above remarks apply to any make of sight feed.—B. B. BLACKBURN, Managing Director, Best and Lloyd, Ltd.

I note that "F.H.M.Y." complains in your issue of December 30th of blow-back of oil through drip feed from front cylinder of 4 h.p. flat twin. I had the same trouble with a new 4 h.p. Douglas in the summer, and, possibly, he may be able to cure it in the same way that I did. I took apart the non-return valve and found that the upper surface of the perforated stud on which the pen-steel disc beds was rough with turning marks. I filed it dead flat with a smooth file, finished off on an oilstone, and since then have had no trouble whatever. Of course, the oil pipe and valve must be kept free from grit and fluff, otherwise the latter is bound to function incorrectly. —F.A. (Cumberland).

UNEVEN RUNNING.

On page 881 of your issue of December 30th you published a letter of your correspondent "R.P." in which he complained of the harsh running of his 2¾ h.p. Douglas. I have just cured much the same trouble on a similar machine, and send my experience herewith in the hope that it may prove useful to "R.P." The harshness was almost entirely due to running with two gauzes (air) on the carburetter. This point is referred to in the Douglas handbook, which recommends two gauzes for jets 27 and 28 and one gauze for jet 26. Personally, I am getting every satisfaction from jet 25. A little tappet adjustment effected a complete cure. Irregular firing was found to be due to a "sticky" rocker arm on the magneto.—E. M. GROSE.

AN ILLUSIVE NOISE.

Under this heading in *The Motor Cycle* of the 30th ult., "H.R." writes on the above subject, and he may find his trouble in the ratchet of the free wheel insufficiently disengaging with the ratchet on the chain wheel in his gear case. If his machine has a late pattern Enfield gear, this will be overcome by oiling the clutch on the chain wheel on the starting handle, which he may have omitted to do. On the earlier pattern I understand there should be a small spring between the two ratchets to throw them apart when the engine starts.—L.D.H.

EXPERIENCES WANTED.

"H.J.B." (Old Trafford).—Hopley, or other folding sidecars.

"N.W." (Bournemouth).—Degory carburetter on Scott.

"D.B.M." (Jerusalem).—Dry battery lighting sets. Life of batteries.

"S.W." (Norwich). — Beardmore-Precision engine. Speed and wear.

"R.W.C." (Stowmarket). — Coulson-B. (4 h.p.). Strength of frame compared with machines of similar power.

"D.B.M." (Jerusalem).—1920 Scott and sidecar. Reliability, accessibility, and starting in daily use all weathers; life of chains, kick starter, etc.

"Notsip" (Dublin). — Success or otherwise of reboring 7-9 h.p. 1913 Indian cylinders; are aluminium pistons advisable?

RECOMMENDED ROUTE.

CARLISLE TO WARWICK (AVOIDING LANCS.). —H.E.P.

Carlisle, Penrith, Shap, Kendal, Kirkby Lonsdale, Ingleton, Clapham, Settle, Skipton, Ilkley, Otley, Poole, Harewood, Collingham, Boston Spa, Tadcaster, Sherburn, Ferrybridge, Doncaster, Bawtry, East Retford, Tuxford, Newark, Leicester, Lutterworth, Rugby, Bilton, Princethorpe, Warwick.

A Cold Job.

"Fifty-Two Week" Road Service.

A.A. Road Service operates continuously and efficiently in midsummer sun or mid-winter snow. It contains no "weather permitting" restrictions, and omits no reasonable requirement. The photograph at the head of this article shows one of the A.A. patrols assisting a motor cycle member during the cold snap last month, and bears witness of the truth of the Automobile Association's slogan "At your Service, Always."

In order to increase the utility of the patrol organisation, A.A. patrols are being mounted on motor cycles, but, when heavy falls of snow or other conditions prevent the use of these cycles, the patrols use their push cycles, or cover the roads as best they can

Valuable adjuncts to the patrol service are the roadside telephone boxes—which are adapted for use by members at any hour of the day or night—roadside motor fuel supply stations (complete with Bowser storage tank and delivery pump, a New Pelapone engine and electric generating set) and "mechanical first-aid" machines carrying spares and tools necessary for light repairs to cars or motor cycles.

These are all innovations in Road Service only to be obtained by membership of the Association.

Other A.A. benefits which are at the service of all members, year in, year out, include free legal defence in any proceedings under the Motor Car Act in Courts of Summary Jurisdiction in the United Kingdom, free legal advice on any matter directly arising out of the use and ownership of cars or motor cycles, and free legal representation in approved civil cases resulting from the use and ownership of such motor vehicles

The Association provides all possible assistance to members touring with their cars or motor cycles either at home or abroad. Home touring facilities include the preparation of routes to suit individual requirements; foreign touring assistance comprises the supply of routes, triptyques and international certificates, also the privilege of taking a car or motor cycle into a 45 per cent. tariff country without paying one penny piece in customs dues.

Members can obtain the advice of qualified engineers on the choice of motor cycles, and the services of competent experts for the examination and trial of any motor vehicle, the purchase of which is contemplated.

A special insurance policy, officially-appointed agents and repairers, A.A. hotels, and the A.A. handbook are other advantages included in the complete service provided by the Association.

The claim that "every need of the reasonable motorist is met by the Association" is, therefore justified, and every motor cyclist who does not carry the A.A. badge should join up at once.

Full particulars of the benefits mentioned above are contained in the booklet, "The Key to the Open Road," a copy of which can be obtained, post free, from the Secretary, The Automobile Association, 21, Fanum House, Whitcomb Street, London, W.C. 2. Write for a copy to-day.

HILL-CLIMBING

THE LITTLE CAR with the BIG HEART

Read following Testimonial:

Dear Sirs,

It might interest you to know that I got delivery of a Tamplin about 3 weeks ago, and to-day I took it up Alms Hill. I am only a novice, and have only been driving about a fortnight, but I feel quite safe with my car. As you know, you can get no run at the hill, but rather foolishly, I managed to get into top, but soon changed back to second. The hill was inclined to be wet and muddy at the beginning, and I had to change to bottom gear about 20 yards farther up. On this gear the machine roared up without a hitch, and with nothing like full throttle. This machine is perfectly standard as it left the works. Yours faithfully, G-V.

Official Hill Climb Successes, 1920.

Alms Hill, 1 in 2·9 clean ascent.
Porlock Hill 1 in 3·5 „ „
South Harting. Fastest in 1,000 c.c. Class.

Consumption at 85 m.p.g. is the rule, 102 m.p.g. has been officially attained with standard car, and over 15,000 miles on original belt and chain.

Tamplin Eng. Works, Kingston Rd., Staines

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable ——— & Co. to ILIFFE & SONS Ltd., and crossed ——— Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

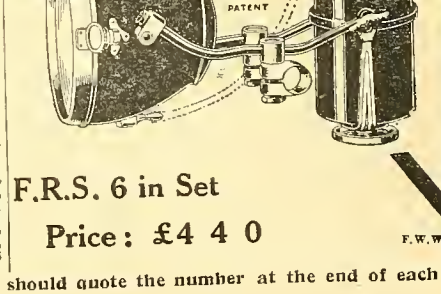
The
Licence Holder
you MUST have!

Don't be rushed into buying Licence Holders produced as a "last moment" effort — you MUST place the holder in the position required by the Government, and it cannot be done unless you have Universal Adjustment. This is where the F.R.S. design stands above all others.

The F.R.S. Holder enables the bracket or clip to be placed at ANY spot—it can swing round to ANY position, and be instantly locked there. ONE NUT regulates the whole thing.

Order NOW—delivery from stock!

Brass, Nickel Plated, Black and Brass, or Black and Nickel Plated 5/-



—and the F.R.S. Streamline Gas Set

Here's the new Streamline model—a perfectly made lamp, of clean and smart appearance. Embodies the ONE NUT adjustable attachment, adjustable focus, genuine optical mangin mirror, non-glare chimneys and special new type of door fastening.

Examine it—and note its marked superiority in design and quality.

HAS IT EVER OCCURRED TO YOU?

That a firm such as THE EASTERN GARAGE COMPANY, who have made steady progress throughout the many years of their career, *must* have consistently served their clients faithfully and well?

Had they not earned the goodwill of their customers, they would long since have joined the *un*lamented dead.

Your complete satisfaction in dealing with THE EASTERN GARAGE COMPANY is assured by the fact that each principle of their business aims at achieving the "Thank you" of every customer.

If you buy a second-hand machine from THE EASTERN GARAGE COMPANY you need not even *think* about its mechanical condition, because you will receive a *guarantee* that it has been completely overhauled, and that the firm accept full responsibility for its future behaviour.

If you are contemplating the purchase of a 1920 model, THE EASTERN GARAGE COMPANY'S list will offer you choice of an excellent selection of machines that are *really* new, and are really reduced in price.

If you want a *definite* delivery date for a new 1921 motor cycle, you may trust the word of THE EASTERN GARAGE COMPANY as though it were in your Bible.

If you wish to settle by extended payments, THE EASTERN GARAGE COMPANY will place before you a plain, straightforward arrangement that can be varied to suit *your* convenience.

Your enquiry will receive prompt and courteous attention from the

STEVENS Lightweight Chassis; price new £7 each, usual price £12.

STEVENS Sidecars.—Fittings can be supplied to suit any type of motor cycle required.

STEVENS Sidecars.—The above cut prices refer only to present stocks, and cannot be repeated when these are exhausted.

STEVENS Sidecars, 184-186, Penteville Rd., King's Cross, London. 'Phone: Central 10264. Illustrated catalogue on request. [6238

HARLEY Sidecars, complete, quite new; £25.—Grimes, 18, Bruton Place, W.1. [6311

SIDECAR ATTACHMENTS.

FOR Sale, Indian sidecar, torpedo, new condition; £11.—Matthews, Stansted, Essex. [5818

CANOELET Sidecar, new condition, suitable Harley; £25, offer.—Burnett, The Clyde, Woolwich. [5616a

COACH Sidecar, shop-soiled only; cost £30, sell £20. —Sinclair, Blencathra, Walton-on-Thames. [5812

RENNOC Sidecars, bodies, hoods, screens. Largest stock in London; actual manufacturers throughout.

RENOC Co. have the finest selection of complete sidecars in the trade.

RENNOC Sidecar Co. have 18 different model sidecars, racing, touring, and tandem models.

RENNOC Sidecar Co. have actually in stock 26 various design sidecar models.

PHŒNIX Sidecars.—All parts supplied from stock, and repairs for this make by the Rennoc Co.

RENNOC Sidecar Co. are actual manufacturers of hoods and wind screens, fitted while you wait.

RENNOC Sidecar Co. undertake repairs to any make of sidecar; complete renovations a speciality.

RENNOC Sidecars are manufactured to fit every make of motor cycle; Harley-Davidsons a speciality.

RENNOC Sidecar Co. have 70 clearance sidecars and bodies to clear at knock-out prices; room wanted. Note.—Send for special clearance list.

RENNOC Co. invite correspondence. Send for 1921 catalogue.—Rennoc Motors, Ltd., Victoria Rd., London, N.4. 'Phone: Hornsey 850.

RENNOC Co. invite clients to view their works and see the famous Rennoc sidecars and bodies being actually built throughout. [6250

COACHBUILT Sidecar Body, roomy, canoe shape, green; £10.—Burton, Lewie Lane, Cirencester. [X4762

MILLFORD Sidecar, coachbuilt, perfect, suit Triumph; £8/10.—W. Ayres, Garage, Kensington Palace. [5754

4 h.p. Douglas Sidecars, fitted with new bodies, latest colours; £17/10.—Snow, 91, Mapledene Rd., Dalston. [5927

1920 Scott Sidecar, with special polished aluminium body; £23.—D. Smith, c/o *The Motor Cycle*, Coventry. [X4750

SWAN Sporting Sidecar, off Harley, good condition, wind screen, luggage grid; £20.—52a, Chertsey Rd., Woking. [5770

SIDECAR, coachbuilt, 4-point attachment, 26in. wheel, roomy; must sell; £7/10.—9, Tollington Place, N.4. [5741

SIDECAR, slightly soiled, but unused, coachbuilt; price £15/10, original price £22/10.—64, Bishopsgate, London. [0399

LICENCE Holders, circular, suit motor cycles or cars, conforming to Transport Ministry regulations.—Below.

LICENCE Holders, black, 3/6; brass, 4/-; aluminium, 4/-; plated, 4/6; postage 6d. Money returned if not satisfied.—Middleton's, below.

MIDDLETON'S are standardising their patent applied for spring wheel sidecars for coming season; rigid sidecars to order.

MIDDLETON'S Spring Wheel Sidecars are guaranteed for 3 years on usual conditions.

MIDDLETON'S (patent applied) one-piece unbreakable chassis axle, with spring wheel, is fitted to all our 2-seaters and sidecars for heavy, powerful machines.

MIDDLETON'S undertake all classes of repairs to motor cycles and sidecars, bodywork, etc.

MIDDLETON'S, London's oldest established sidecar makers, 27, Stroud Green Rd., Finsbury Park. 'Phone: Hornsey 1584. [4809

BASTONE'S for Sidecars and Bodies; no better or cheaper house. Kindly inspect our models before purchasing elsewhere.

BASTONE'S.—New 1921 sporting and other models in stock. Bodies from £4/10; complete sidecars from £16/10.

BASTONE'S.—We have a few soiled sidecars and bodies to clear at low prices.

BASTONE'S.—Distributing agents for the famous Montgomery sidecars. Latest 1921 sporting and other models in stock; trade supplied.

BASTONE'S (Sidecar Dept.), 228, Pentonville Rd., King's Cross, London, N.1. Tel.: 2481 North. [5533

ROYAL Leicester Sidecars to suit all machines, roomy bodies, comfortable upholstery, excellent springing; prices from £19/10 upwards.

SEND Your Sidecar to us for renovation. New hoods, wind screens, and aprons fitted. Write for catalogue.

THE Willowbrook Co., Royal Leicester Sidecar Works, Belgrave Gate, Leicester. [0335

HARLEY Sidecar, right-hand, latest colour, good condition, 1918 metal body; offers.—Larter, Twyford Rd., Bishop's Stortford. [6007

1920 Watsonian Coupe, nearly new, mileage 30, large locker, wind screen, dash, side wings; £35.—13, Alfred Place, South Kensington. [5886

CRABTREE & SON, Ltd.,

The British Magneto.

ONLY those directly concerned with the production of British magnetos can fully appreciate the difficulties overcome in bringing about the present high quality of magnetos fitted to post-war motor cycles. Prior to 1914, the magneto industry was practically a German monopoly, and, despite the warnings from *The Motor Cycle* and *The Autocar*, nothing was done to remedy this state of affairs until after the war had broken out.

At long last, however, the Government recognised the gravity of the situation, and promises were made to the then young British magneto industry which, by exhaustive research work and experimenting finally produced ignition apparatus which has proved to be superior to the German article. Thus a new industry sprang up, making the motor users of this country independent of outside supplies.

So far—after two years of peace—nothing has been done in spite of promises, and, in the meantime, the British industry is faced with a possibility of severe price competition from Germany, which threatens the whole fabric built up with such painstaking care.

At the moment, motor cyclists have a prejudice against German goods, and this prejudice makes motor cycle manufacturers hesitate about fitting the German magnetos now offered at cut prices.

Very shortly now Parliament will reassemble, and the question of key industries will be discussed. Will the Government realise the importance of the magneto sufficiently to make its manufacture a key industry? We sincerely hope so, otherwise a few years may see the British article gradually ousted by ruthless price cutting until the same conditions prevail as in 1914.

The present rate of exchange is all in favour of the German magneto, and, while every motor cyclist desires to see a reduction in prices, we feel sure he does not wish to save a small amount at the expense of a vital industry.

Elsewhere in this issue we publish some rather disturbing facts concerning the magneto industry, the fate of which appears to hang in the balance.

Car Practice and the Motor Cycle.

IMMEDIATELY after the Olympia Show, we gave an article on motor cycle design from a car owner's point of view, and two weeks later published a fair criticism of the views expressed therein; the criticism expressed confidence in present day motor cycle design.

It has long been what may be termed a habit of critics to assume that modern car practice is an ideal to be applied to motor cycles, and the articles already mentioned serve to show that the single track machine has no need to seek ideals outside its particular sphere. The two types of vehicle are so totally different that it is doubtful whether either can gain much from the other. One thing is certain—if motor cycles were designed to embody all the points favoured by the car expert, there would no longer be the wide difference between their prices. Such car features as internal expanding brakes, interchangeable wheels, and dynamo lighting equipment have all contributed to the extra cost of the modern motor cycle as compared with the pre-war type, and while no one will deny the advantage of such refinements, it is clear that every extra step towards car practice only tends towards extravagance in design. It may be an ideal to produce a car on two wheels, but ideals are not always profitable either to maker or user. Not only is such over-elaboration costly and unnecessary, but it is extremely doubtful whether a too ready acceptance of car features is desirable from a mechanical point of view.

We agree with our contributor, who urges that each type of vehicle be allowed to develop without outside influences, and have sufficient confidence in the British manufacturers ultimately being able to produce machines which are as perfect from the motor cyclist's point of view as are cars in the eyes of those critics who are in another field.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Audacity.

ONE of the fundamental defects of the bureaucrat is that he thinks in terms of the Strand and the dictaphone. He fancies that a square furlong of the West End is typical of the whole of England, and that because he can enforce his will on Piccadilly by an Order in Council, therefore his writ will run in Cumberland or Cornwall. Consequently, I yelped with glee when I read that Sir Eric Geddes was going to wash out warning signs on main roads where they make a plus sign with byroads; and throw the onus of safety and caution on traffic debouching from the byroads. Mind you, in theory I wholly agree with him. Cheap, fast transport plays a bigger part in prosperity for England than many people understand, and it is a crime to retard important through traffic for the sake of Hodge, who dreams of his lady-love as he crosses the London-Birmingham artery with a cartload of mangold-wurzels.

Bravo, the A.C.U.!

I HAVE so often been rude to the A.C.U. that I really must eat humble pie to-day, and congratulate them that, if their 1921 Six Day notions are more than kite-flying, they have at last recognised the physical difference between a chamois and a motor cycle. I have seldom studied so statesmanlike and sensible a competition programme. The sporting riders will doubtless form an unholy alliance of protest with any chuckle-headed makers who don't understand that the average rider is a close relation of Poy's John Citizen, and would pay £5 rather than try to climb Park Rash. But the sporting riders will still be able to find all they want in the Scottish Six Days, not to speak of innumerable one day events. Meanwhile, the A.C.U. Six Days looks like evolving just the kind of 'bus which most riders want, and which most agents can sell. Nevertheless, is it wise to make all machines of over 350 c.c. tow a sidecar?

A Sidecar Six Days?

EVER since motor cycle trials began, organisers have been groping for some dodge which would allow every involuntary stop to be registered and penalised. Oldsters like myself can recall trials in which continuous observation of the riders by travelling marshals was attempted; in which each rider acted as a spy upon another rider; in which we were put on our honour, like schoolgirls, to confess our own lapses from grace at the end of the day. All these methods broke down. So organisers were driven to undesirable and foolish expedients. The A.C.U. went baldheaded for freak hills, the M.C.C. for split seconds, and so on. To judge by the present proposals, the A.C.U. is now coquetting with the plan of concentrating the real torture at Brooklands, planing down the road trial into triviality, and making all machines over 350 c.c. carry an official observer in a sidecar. The stunt is extraordinarily attractive at first sight. It would enable us to find our winner by commonsense, instead of by some weird and idiotic trick. But, as the draft rule runs, it isn't fair on the bigger engines, and it threatens to strangle the movement towards weight reduction. Perhaps the spring discussions will wangle some scheme for retaining the non-stop notion without doing real harm in other directions.

The Outside Flywheel.

"CRITICUS" denounces inside flywheels because of oil friction. "Wharfedale" approves them as being cheaper to make, more easily enclosed, and as lending themselves better to motor cycle transmissions. Neither gentleman so much as mentions the flywheel magneto. This gadget is still in its infancy, but surely it is possible that it will have a big effect on design in certain classes?

Lubrication Problems.

THE car owner attacks our oiling systems because they are extravagant of oil, non-uniform in action, and produce rapid carbonisation. "Wharfedale" admits the over-oiling, but deprecates any slavish copying of car systems. Briefly, there are three leading systems:

1. The hand pump. Entirely dependent on the rider's *memory*.
2. The drip feed. Largely dependent on the rider's *sight*, but the drip is often invisible (darkness, oily glass, driver distracted by other matters, etc.). Consequently many amateurs use the drip much as if it were a hand pump, and oil by memory, giving a pumpful every five miles or so.
3. Automatic systems.

It is obvious that the first two systems must always be inaccurate and wasteful, except with a remarkably methodical and painstaking rider. Where either of these systems is properly handled, and obtains the best results, those results are obtained at too great a cost. No sane motor cyclist desires to have his thoughts concentrated on his engine all day long. One of the crying needs of the British motor cycle trade is the development of the best automatic lubrication system.

Car Brakes.

ON the other hand, I am wholly in agreement with "Wharfedale" when he pleads for the retention of the belt-rim brake. I have yet to own a rim brake or an external band brake which could be deemed ideal. Internal-expanding brakes are neat and

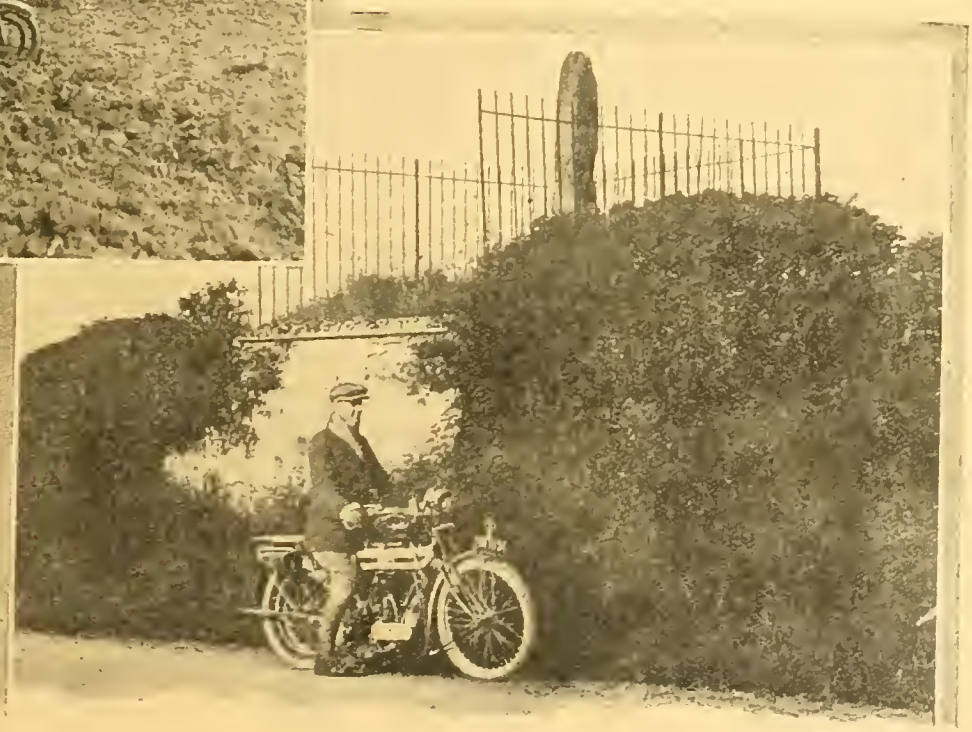
Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Occasional Comments.—

compact. When they are new, their action is delightful. As they age, one begins to criticise them. The friction arcs gradually shrink to a couple of humps, and subsequent wear is very rapid. It is generally rather a job to fit new shoes, and the same applies if lined shoes are utilised; the average amateur is hardly equal to the riveting and truing up which are needed. The records of the Patent Office bristle with suggestions for perfecting the internal expanding brake, but nobody has yet managed to work out a pattern which is cheap and simple, as well as efficient.

Paying Up.

ON January 4th I duly received (unasked) one of the new registration forms from the County Council concerned. The Ministry of Transport has carried into practice its anomaly of allowing car taxes to be paid by quarterly instalments, provided you pay 20% extra on the year: but compels motor cycle prices to be paid annually in one bite. So if your 8 h.p. three-wheeler weighs 897 lb., you can either pay £8 down or pay £9 12s. in four quarterly instalments; but if your 8 h.p. three-wheeler weighs 895 lb., you only pay £4. but you must disgorge that sum right away. Funny how the brains of super-bureaucrats work, isn't it? Presumably the quarterly permission in respect of car taxes is to cheer up the owner of a single Ford taxi; but I don't know that he needs more consideration than the small canvasser, who uses a Morgan for his business rounds.

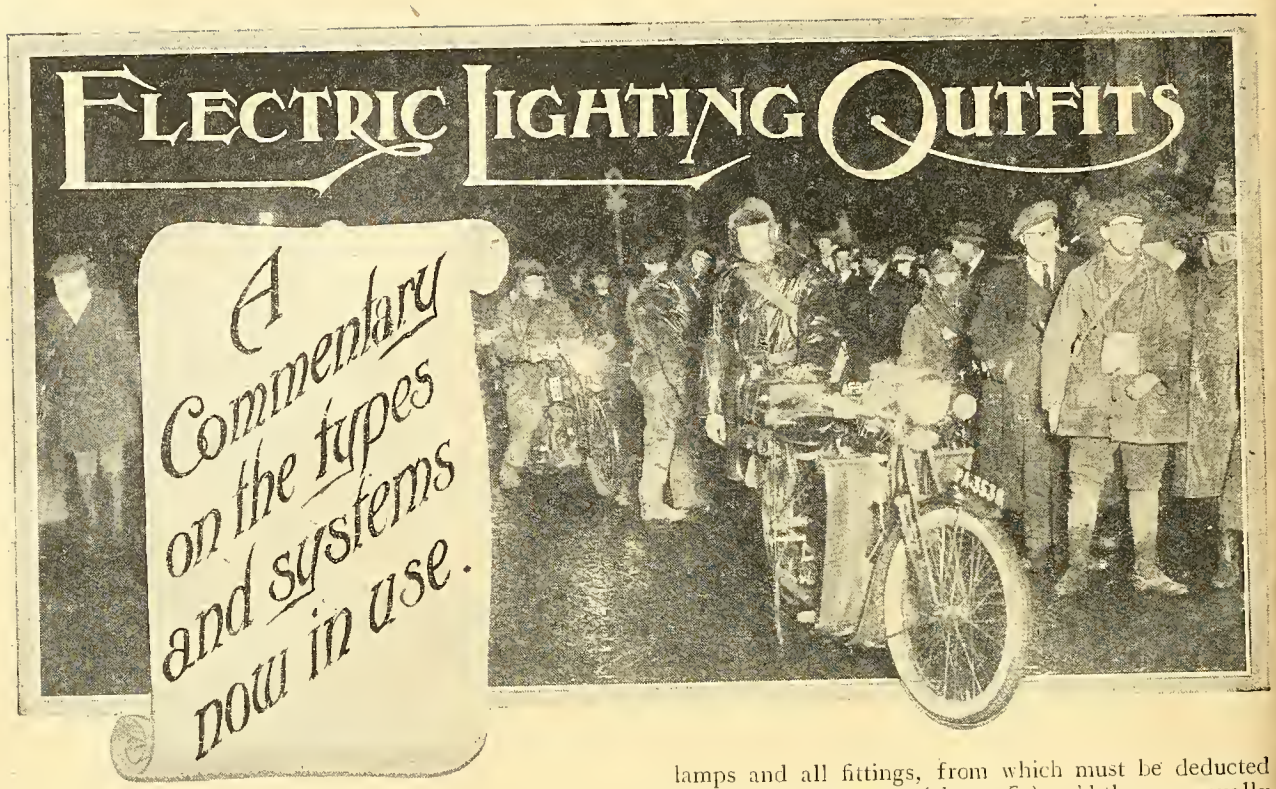


Of course, my personal rage is due to the fact that I do not keep many of my machines for as long a period as one year, so that somebody else will get the benefit of half my taxes.

A Question of Diagnosis.

THE amateur who recently described in our columns how he renovated an aged and neglected Morgan found that the rear wheel spindle was U shaped. He ascribed this to the machine having sustained a violent skid at some time in its history. It may be so. But I once knew a joyous agent who amassed his living principally out of a single customer, to whom he had sold a Morgan. This customer was of the breed who are fundamentally incapable of performing two different actions simultaneously—you remember the old parlour trick of patting your head and rubbing your tummy simultaneously, and how few people can do it at the first try? So this customer used in careful series to (1) open his throttle wide; (2) take out his clutch; (3) engage bottom gear; and thus (4) take his foot off the clutch pedal.

The immediate result was a buckled back spindle. He placed a standing order for a new spindle every Monday morning. I think our contributor may have bought that Morgan!



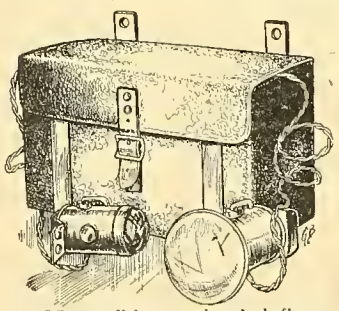
ROADSIDE CURIOSITIES.

(Left) Even ploughed fields did not deter the B.S.A. owner—who is evidently an enthusiastic archæologist—from inspecting at close quarters this so-called "Devil's Arrow," situated on the Great North Road, near Boroughbridge.

(Right) Another wayside relic—Legg's Cross, between West Auckland and Gainford, Durham. Legend has it that King John sat upon this stone to survey the surrounding country.

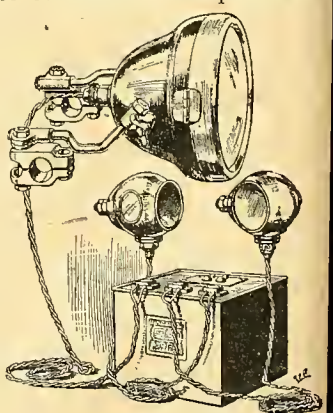
ELECTRIC LIGHTING OUTFITS

A Commentary on the types and systems now in use.



THE motor cyclist of to-day enjoys a choice between five different types of electric lighting outfits, viz.:

1. Dynamo sets separate from the magneto, and so requiring a special transmission.
2. Dynamo sets combined with the magneto.
3. Accumulator sets, minus a dynamo.
4. Dry battery sets.
5. The B.T.H. "Sparklight," which utilises surplus current generated by the magneto, and dispenses with the need for a dynamo; it is at present only applicable to small two-stroke engines.

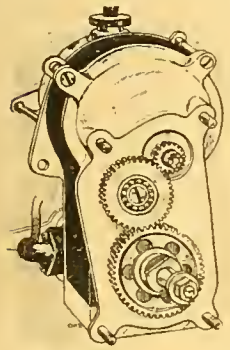


With such a wealth of choice available, the inexperienced rider may be glad of a few notes on the pros and cons of these different outfits.

Combined Ignition and Lighting Systems.

The magneto-dynamo installations, namely, the Lucas Magdyno and the M.L. Maglita, are unquestionably the most attractive for touring machines when a new mount is being purchased and the necessary capital is available. Their "cons" are obvious. They add about 7 lb. to the weight of the motor cycle, as compared with an acetylene outfit. They cost from £25 to £30 complete with lamps and all fittings, from which must be deducted the price of a magneto (about £7), and the sum usually paid for a gas set (about £6); so that they are an extravagance to the tune of at least £12. No price, however, has been standardised for such outfits; in some cases, after allowing for magneto, the figure is £28. Of course many are quite prepared to put up with the small increases of weight and price in order to obtain the utmost convenience and efficiency in their lamps. The advantages are unquestionable. The illumination is superb, and very reliable. The devices are extremely compact and sightly. The Maglita entails no additional drive of any kind, there being but one revolving armature. The Magdyno lighting armature is driven by enclosed gears packed in grease, and is just as reliable as the distributer drive of a multi-cylinder car type magneto. In neither case is the ignition interfered with or rendered less dependable. The Magdyno will furnish the usual ignition spark if the dynamo is completely removed from the instrument, a job which a raw novice can perform in a few seconds. The Maglita will light the lamps without the aid of a battery. Both instruments include "dimming" devices, and the bulbs generally may be focussed to give a short, broad beam.

The well-known electrical firm of Siemens favour dry batteries for their lighting equipment.



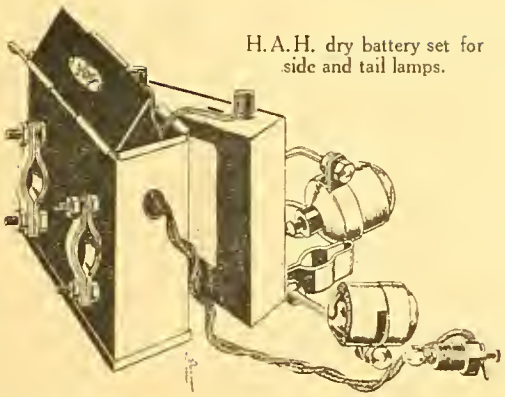
Volex dry battery lighting equipment made by Ward and Goldstone.

Electric Lighting Outfits.—

or a long narrow beam. The uncertainty and messiness of an acetylene generator are eliminated.

Other dynamo sets (Type I.) will often be preferred when a rider wishes to convert an existing motor cycle to electric lighting; for he has to buy a new source of ignition if he wishes to fit the Magdyno or Maglita, and he may not be able to obtain a high price for his old magneto. The separate dynamo sets are, in most cases, honest electrical jobs. Their drawback is that a special drive has to be faked up, which may take the form of a link-grip belt or a friction drive off the tyre or off a special friction pulley clipped to the spokes; these friction drives are not always satisfactory, whilst a belt drive ought to include a mechanical adjustment for the tension. When these separate dynamos are installed, the machine is apt to look rather "patchy"; but the system remains the most workmanlike method of economical conversion, though it is not so neat as installing a magneto-dynamo set after selling the old magneto.

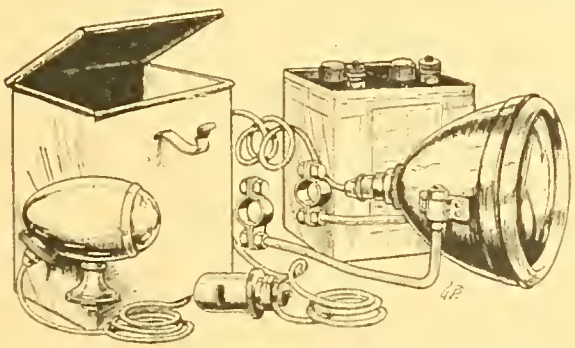
The Magdyno in which the magneto and the dynamo are separate units but driven together through the medium of a gear wheel between the two armature shafts.



Accumulator Sets.

Many riders employ accumulator sets without fitting a dynamo of any kind. In this case the accumulators must be removed from the cycle at least once a month—oftener if much nightwork is done—and recharged at a garage, at a power station, or off the domestic lighting circuit. The conditions essential to success with this form of lighting are obvious, viz.:

(a) The rider must either be a fair electrician, or must be able to trust the person who charges the cells for him (at some public charging stations the work is slipshod).

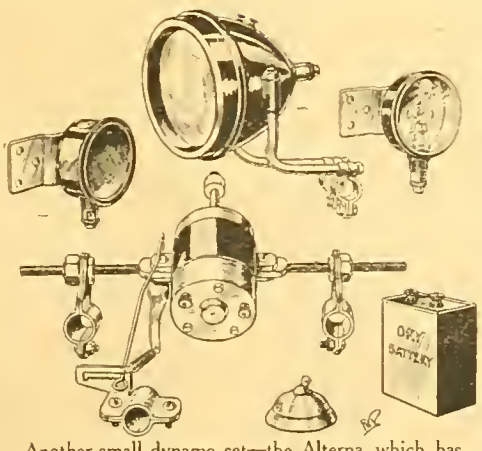


(b) Regular nightwork in winter over a good mileage will necessitate frequent recharging.

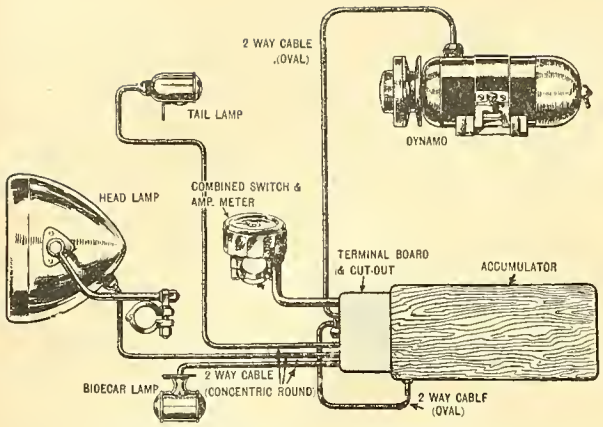
(c) Storage must be found on the machine for a well-constructed accumulator of good capacity. (Suitable storage is easily rigged up in a sidecar, but is a real problem on a solo mount.) A battery of which the road work is all discharge and no charge must be larger and better than a battery which is simultaneously discharged by the lamps and recharged by an engine-driven dynamo.

H.A.H. dry battery set for side and tail lamps.

Dry battery sets have earned widely differing verdicts from their users. Their chief drawback lies in the fact that no dry battery thrives on heavy and continuous discharges; therefore regular and prolonged night work soon compels the purchase of a new battery, which is nowadays a really expensive item. (Dry batteries cannot be recharged. They can be freshened up a little by drilling holes in the case and soaking the cells in a saturated solution of sal ammoniac: but the effect is evanescent.) For similar reasons it is not practicable to obtain the maximum light from a dry battery head lamp; the heavy discharge rate of a really powerful bulb will soon exhaust the cells. The writer's personal experiences with such sets all go to indicate that they are best reserved for intermittent work over short distances: but a dry battery tail lamp is a good auxiliary to a gas head lamp, and is far more reliable than the average gas tail lamp.

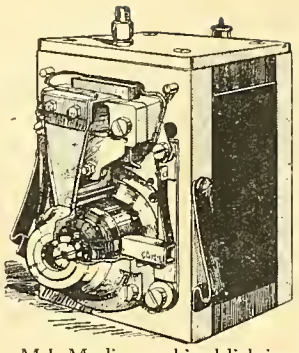


The Meteor accumulator set includes a metal case for the battery.

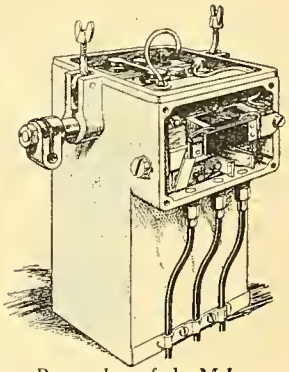


For Minature Two-strokes.

The B.T.H. Sparklight is a real boon for baby two-strokes. It is extremely light and cheap, and should certainly be specified when a new baby two-stroke is ordered. Its operation is entirely automatic, it cannot upset the ignition, and it will light the lamps without the aid of the battery, should the latter get out of order; of course, under these circumstances the lamps will only light up with the engine running at about 500 r.p.m. or over.



It is not altogether easy to compare the relative costs of the various lighting systems. But it is only fair to say that the acetylene generator sets are still the cheapest to maintain. The dissolved acetylene outfits are not much dearer to buy than a gas generator set, and afford the most reliable light in the world; short of exhausting a cylinder unex-

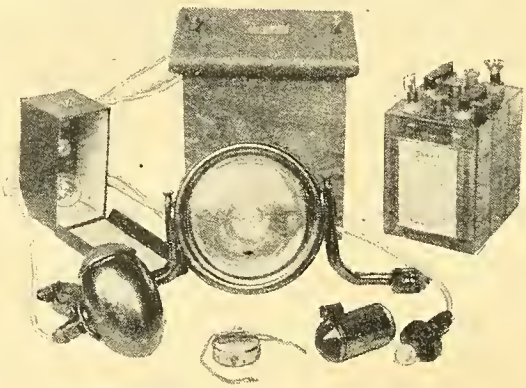


Another small dynamo set—the Alterna, which has a dry battery for service when the engine is not running.

Powell and Hanmer's dynamo lighting set.

M-L Maglita combined lighting and ignition apparatus.

Battery box of the M-L set which is carried in the position usually adopted for gas generators.



pectedly, no roadside trouble can occur, and this mishap may be guarded against by using a pressure gauge before long runs, or by carrying a reserve cylinder in the sidecar. Replacement cylinders now cost 6s., and the same value in carbide will give a longer light.

An accumulator set is hardly more costly than a gas generator set, and will give upwards of four hours' light on a charge, according to the capacity of the battery and the consumption of the bulbs. The cost of charging varies from 1s. upwards.

Dry Batteries.

The running expenses of a dry battery set are frightfully heavy if a powerful head lamp is used for long distances, as a glance at a price list of replacement cells will indicate. On the other hand, the cost of maintaining a dry battery rear lamp is very reasonable; and if the machine is only used intermittently at nights (as most machines are), the head lamp battery may last for weeks or even months, according to the distance covered.

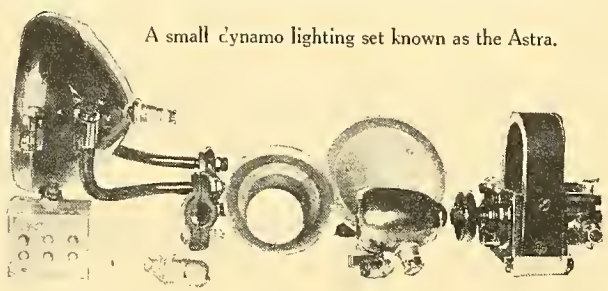
Dynamo outfits require very little outlay after purchase, but in considering their financial economy the loss of interest on capital must be charged. If the outfit costs £10 over and above the cost of an ordinary magneto and the lamps, the lost interest is 12s. a year. A certain number of new bulbs will probably be required, and head lamp bulbs may cost 3s. apiece.

A good example of the modern accumulator set—produced by Godfreys.

A duffer will probably seek professional help once or twice in a season for some slight defect or adjustment. A length or two of wiring may suffer accidental damage and extra petrol is consumed in driving the dynamo. It is doubtful whether these sets are any cheaper to maintain than a gas outfit.

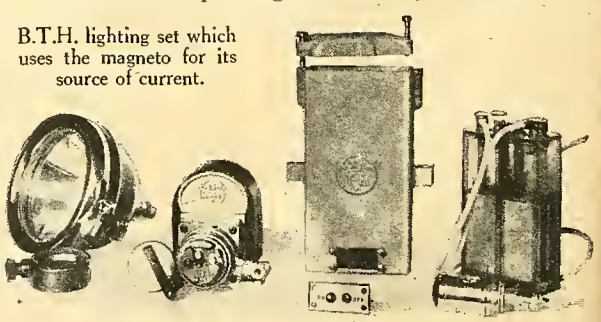
Wherever an accumulator is used, economy will largely hinge upon the care with which it is maintained.

Care of Cells.



The essential points are as follows:

1. Never let the accumulator stand when discharged. If it cannot be charged up on the machine immediately, remove it, and get it charged elsewhere without delay.



2. Never let the liquid in the cells fall below the tops of the plates. Replace small losses with distilled water. Replace serious losses (*e.g.*, after upsetting a cell) by adding a solution made up of one part of pure brimstone sulphuric acid to five parts of distilled water. N.B.—Always *add acid to water*, and allow solution to cool before pouring into the cells. (Note particularly that it is very dangerous to add water to concentrated acid.)

3. Remember that vibration is very bad for accumulators. It causes the plates to shed their paste, which may produce an internal short circuit. Pack the accumulators in their case with care, insulating them with rubber packing so that they cannot move.

A small dynamo lighting set known as the Astra.

B.T.H. lighting set which uses the magneto for its source of current.

RE-BUILDING OUR CREDIT OVERSEAS.

Exports of British Motor Cycles nearly Six Times Greater than Imports.

£2,340,557 is the total value of British motor cycles and parts (not including tyres ordered apart from machines) exported during 1920.

It is a figure that will take some explaining away by the pessimist who affirms that our manufacturers are neglecting the Overseas market. £1,672,903 of this amount represents the value of 21,304 actual motor cycles exported, while the remaining £567,654 was expended on "parts," viz., component parts, accessories, and spares. A simple division sum makes the value of each machine to be approximately £78 10s., which, after allowing for traders' discounts, still proves that a great many lightweights find their way abroad. It is unfortunate that no statistics classifying the types of machines are available, for we feel sure that the proportion of low-priced lightweights must be very high.

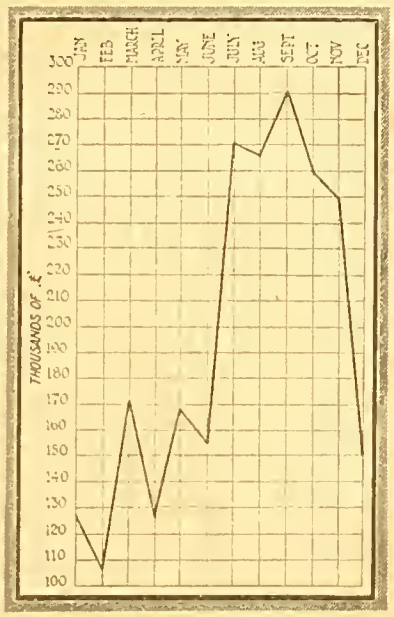
But these, remarkable as they are, are not the only interesting facts that may be culled from the summary of our Overseas trade in the Board of Trade monthly returns for 1920. Import figures, for example, provide further food for thought.

A graphical illustration of the fluctoating monthly totals of motor cycle imports.

Last year we imported no fewer than 4,305 motor cycles—almost wholly, of course, from America—to a net value of £285,820, and a gross value, including "parts" (but, again, excluding distinct tyre consignments), of £407,429. Average values in this case work out at approximately £66 5s., but a 33⅓% *ad valorem* duty brings the total almost up to three figures. Apart from other sources of information, we are obviously justified in considering the majority of these machines to be heavyweights. Incidentally, the Exchequer benefits to the extent of £135,808 on this importation.

As we indicated last week, a comparison of 1920's total imports and total exports of motor cycles and parts reveals the reassuring fact that the value of the exports is nearly six times the value of our imports. This is even more satisfactory when it is observed that a similar comparison of the grand totals of *all* goods and merchandise entering and leaving the United Kingdom during the same period shows a ratio of approximately 19 to 13 *in favour of the imports;* but it must also be noted that in 1919 our motor cycle exports were more than *eight* times as valuable as the imports.

Records—Not at Brooklands.



As may also be observed from Table I. on this page, export figures have more than doubled, and imports trebled 1919 amounts. In both cases, of course, 1920 totals are much higher than any previously attained, although the actual number of exported machines in 1913 (which is regarded as a record year, and when they averaged only £43 apiece!) reached the fine total of 16,850 compared with 21,304 in 1920.

Turning to monthly returns, which we show graphically, two most interesting diagrams are provided. Taking exports first, the seesaw fluctuations of the earlier half of the year are somewhat mystifying, but such sharp contrasts as are exhibited in March and April are probably more due to the laws of chance than the more definite law of supply and demand.

It is customary, but probably wrong (although no reliable statistics are published), to assume that the majority of our exported motor cycles go to the Southern Hemisphere; and, although the high line from July to November may be taken as evidence of a Southern "spring demand," it seems more feasible to assume that only when the demand in this country eased off somewhat did our manufacturers turn really seriously to exportation. Although December is a disappointment, it is, nevertheless, at a considerably higher level than December, 1919.

Rapid Decline in Imports.

The import line zigzags almost unaccountably, until we recall that *supply* and *demand* must be considered independently on this market. For example, the demand was very great in May, although actual supply was low; and, by the time the supply got really adequate, the demand had begun to slacken off. The rapid decline following is the most understandable feature of a hectic year. December's figure is less than half that of the corresponding month in 1919; and only half of the £16,820 represents complete machines (just 106 all told).

On this diagram the great activity in the export market from July to November last year is shown in a striking manner.

Last year, as we have indicated earlier, tyres were tabulated independently; and, as automobile and perambulator types are also lumped in, their figures are probably not of engrossing interest to our readers. £5,577,078 of these tyres were imported, and £6,500,761 exported: a rather curious state of affairs.

207,739,144 gallons—say it in words!—of motor spirit, to a declared value of £23,360,119, entered this country last year: an increase over 1919 of 30% in value, but only 4% in amount. Only half this amount was imported in 1913.

Finally nothing serves to emphasise the satisfactory and nationally helpful state of the British motor cycle industry more than a comparison with the corresponding trading figures from the automobile world: for last year the value of exported cars failed to reach half the value of similar imports.

TABLE I.

	1913.	1919.	1920.
British Exports.			
Number of British motor cycles exported	16,850	8,368	21,304
Total value of British motor cycles and parts exported	£950,500	£809,177	£2,310,557
Imports.			
Number of motor cycles imported	1,728	1,485	4,305
Total value of motor cycles and parts imported	£166,021	£107,572	£107,429

TABLE II.
MONTHLY VALUES OF IMPORTS AND EXPORTS DURING 1920.

	Imports.	Exports.
	£	£
Jan.	38,265	126,830
Feb.	25,522	106,730

Nov.	20,491	249,689
Dec.	16,820	150,618
Total	£107,129	£2,340,557

The New "Six Days" Scheme.

Points of the Suggested A.C.U. Regulations for the 1921 Big Trials.

THERE is a sense in which all sporting riders and all veterans will regret the proposed changes in the organisation of the Six Days Trial. Ever since its inception in 1903 the Trial has topped the competition programme, furnished a most sporting week, and strung the interest of riders throughout the kingdom to a very high pitch. Now the event is to be boiled down to four days of roadwork—restricted to fair surfaces and easy gradients—and the remaining two days will be occupied in a series of technical tests, reminiscent rather of the bench acceptance tests of an aero engine or a tank engine, than of the old "hell-for-leather" business.

Nevertheless it is quite beyond question that the change is wise and statesmanlike. If some association interested in perambulators were to offer gold medals for the best ascent of a telegraph pole by a perambulator containing twins, the spectators would enjoy unlimited fun, and the successful nursemaids would undoubtedly deserve their medals. But the resulting type of perambulator would not necessarily be such as the twins and their mother might desire. It is on such Heath Robinson principles that the last Six Days was run. If the new proposals are carried out in their entirety, they will tend to develop the sort of machine which nine out of every ten riders want. The novel factors which are to be introduced include the following items, all of which are vital to the satisfaction of the average owner:

1. Petrol and oil consumption.
2. Mudguarding.
3. Springing.
4. Oil retention.

Reliability will be severely tested by the seventy-five mile high speed test which concludes the actual riding. Brooklands test hill will guarantee the climbing power. Brakes are to be tested separately (this will surely arouse much controversy about front wheel brakes). The only points which have been overlooked are comparatively secondary, and may possibly be incorporated in the 1922 event. Obvious omissions of great interest to the private owner are:

5. Ease of cleaning.
6. Accessibility (especially in reference to tyre repairs on all machines, and to mechanical adjustments on sidecar outfits).
7. Quality and design of tool outfits.
8. Value for money.

As recorded in our issue for December 23rd, it is intended to introduce several new features in this year's A.C.U. Six Days Trials.

The start will be from Brooklands, where the machines will be subjected to a preliminary examination and certain eliminating tests, including a test of mudguarding over a prepared surface, top gear slow running and silencer tests.

Brooklands is also to be the scene of the finish of the Trial when the surviving competitors will be required to maintain certain specified mimimum speeds for 25 laps.

It is also suggested that every machine over 350 c.c. shall be required to be fitted with a sidecar.

A Drastic Change.

The suggestion that all engines exceeding 350 c.c. must pull sidecars through the trial may mean a great deal more than is stated in the draft. It may imply that the A.C.U. intend to equip the bulk of the entry with an official observer, and to run the event on a non-stop basis, with a penalty for every stoppage of any sort or kind. At first sight this possibility is exceedingly attractive. Non-stop trials have been very largely responsible for developing cars to what they now are. Petty stops are far too common with many makes of motor cycle. This innovation would show up the "class" of the different types and different makes with great faithfulness. The adoption of the non-stop principle is probably impossible unless sidecars are made compulsory, and in most directions it would be extremely beneficial.

But there are two or three equally serious snags about it. For example, if I may take familiar names in vain, the 4 h.p. Triumph, the 3 h.p. A.B.C., and the 2¾ h.p. Douglas all sell freely to solo enthusiasts. Of this trio, the Triumph and A.B.C. exceed 350 c.c., and would therefore have to pull sidecars. These machines would necessarily be far more severely tested and far more closely observed than the Douglas. Given reasonable roads, the Douglas (or its equivalent) could easily take a sidecar through the road portion of the trial with credit, as could many of the little two-strokes and J.A.P.-engined lightweights now on the market, but it would be unfair and disastrous. The multi-lap high-speed test at Brooklands would be much more severe on a 350 c.c. sidecar outfit than on a genuine dual-purpose machine like the sturdy Triumph. It would tend to increase the weight of the 350 c.c. machines, whereas there is real need for their weight to come down.

Discouraging the Solo Mount.

No wise enthusiast will hastily denounce careful efforts to run the Six Days on a non-stop principle. But two preliminary cautions are essential. If the non-stop principle is applied, it must be applied fairly, and it must not hamper the new movement towards lighter solo machines. The new taxation scheme tends to encourage machines which weigh under 200 lb. Popular demand was already pushing in the same direction; the new light Sunbeam, Coulson, etc., were already showing the folly of building one and the same 'bus for the solo tourist and the sidecar potterer. The A.C.U. must encourage this tendency, instead of crabbing it.

Can they find a way out of this dilemma? It is difficult to find an escape. Personally, I value the non-stop principle so enormously that I dare not denounce it offhand and without reserve, though it threatens great sacrifices. I wonder whether the A.C.U. can devise some other method of encouraging the light solo 'buses if they should be penalised in the Six Days by this suggested rule. Could they be given compensating attention in a series of shorter trials? What would be the effect of making sidecars compulsory on all Six Day entries exceeding 200 lb.? Could the problem be dodged by including in the Six

The New "Six Days" Scheme.—

Days a special solo class, in which the entering manufacturers pledged themselves to deliver duplicates with the usual guarantee plus a voidance clause in the event of a sidecar being fitted? I doubt whether any satisfactory solution can be found, and in that event I fear the non-stop principle ought to be abandoned.

The scheme is considerably more audacious than it appears, for although it is easy to frame, it is very difficult to carry out. It will demand the most meticulous organisation and a host of first-class minor officials. However admirably it is planned and staffed, it will unfortunately be extremely boring to the participants and to the spectators. It should prove worth the trouble, for it will produce rapid acceleration of development in the points which matter. A strictly limited entry would appear desirable.

The pitfall of a limited entry is that the results are apt to flatter the trade and humbug the public, seeing that almost any firm can prepare a single super machine and provide a super tuner. There may consequently be some suggestion that the A.C.U. should after receiving entries purchase examples of the entered makes at random from the stocks of local dealers, instead of accepting machines selected and prepared by the entrants. I doubt whether any such complicated system is necessary. A glance at the items selected for rewards and penalties indicates that they are mostly elements of design rather than matters of tune. No doubt the machines which do best in the 1921 Trial will differ from the 1921 machines sold to the public. But twelve months should set this right. The new mudguards, the new springing, the new oil trapping devices, the new carburetter design will surely grace the 1922 models. A trial fulfils its purpose when it forces upon the manufacturer's next year model such alterations as the greater bulk of his customers desire.

B. H. DAVIES.

The 1921 Grand Prix.

An Important Continental Event for Motor Cycles, to be held at the Time of the Car Race.

AS announced in last week's issue, a Motor Cycle Grand Prix will be held in France next July, in conjunction with the three-litre motor car race, near Le Mans. This event will be the most important motor cycle speed contest of the year on the Continent, and will be under the direct control of the Union Motocycliste, which is the national body controlling motor cycle races and competitions in France.

It will be remembered that the Automobile Club of France decided, several months ago, to revive its Grand Prix race in 1921, this event having been interrupted by the war and the unsettled conditions since the Armistice. Every indication pointed to the selection of a course near Strasbourg for this important event; but, owing to the slowness of the Alsatian authorities to give the guarantees required by the Automobile Club, this body suddenly decided to accept the offer of Le Mans to prepare a course and pay an important subsidy for the race.

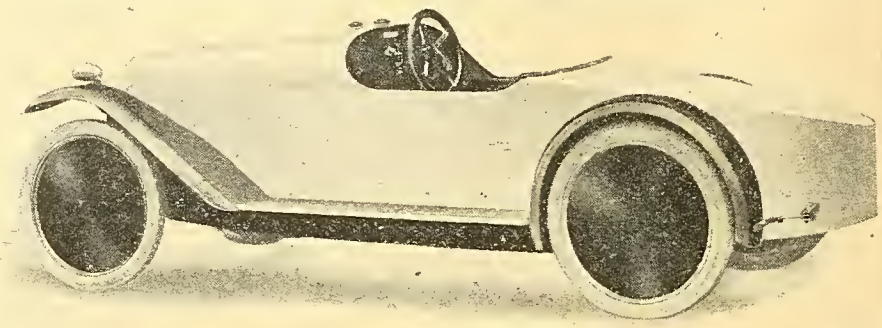
The Grand Prix having been fixed for Saturday, July 23rd, the decision was taken at a recent meeting of the Sporting Commission of the Automobile Club of France to hold a motor cycle event on the preceding day and over the same course. The rules have not yet been drawn up, for motor cycling in France is under the control of the Union Motocycliste, and not directly in the hands of the Sporting Commission. It is understood, however, that the French Motor Cycle Grand Prix will be over a distance of three hundred miles. Solo machines only will be admitted.

On the course at Le Mans, where the Grand Prix Race will be held in July. Top: Through the pine forests near Le Mans. Bottom: One of the best stretches.

The circuit is ten and a half miles, the roads are fairly level, the country is wild and deserted, and there are three sharp turns, only one of which, however, will cause any real difficulty to riders. For the Grand Prix it is intended to relay the entire road surface.

A Monocar with a Dickey Seat.

A Promising Cycle Car, embodying Well-known Motor Cycle Engine and Gear Units.



ALTHOUGH there is undoubtedly a demand for an efficient monocar, it suffers, like the solo motor cycle with a carrier, in that a second passenger cannot be carried. The designer of the Baughan monocar illustrated no doubt appreciate this, and has taken his cue from the number of solo motor cycles now fitted with Tan-Sad and similar seats, for, although all the advantages of a solo four-wheeler are retained, in addition a convenient dickey seat forms part of the equipment.

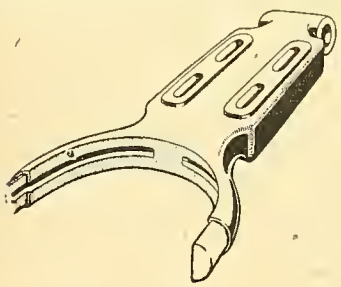
An Unusual Transmission.

The Baughan is a new proposition introduced by Messrs. Baughan Motors, of Lower Street, Stroud, Gloucestershire, and has an 8 h.p. twin Blackburne engine placed across the front end of the frame. The primary drive is by shaft to a small gear box behind the driver's seat, containing a bevel gear, from the cross-shaft of which a "spider" conveys the drive to the outer member of the clutch of a Sturmey-Archer three-speed gear box. A short chain is used for the final drive to the rear axle, a shock absorber being embodied.

Quarter-elliptic springs are used at both ends, and at the rear girder-constructed rods are used and the spring ends allowed to slide in their housings. The specification also includes 650×65 mm. tyres on detachable wheels, Capac carburetter, domed-shaped mudguards, and an efficient cooling fan.

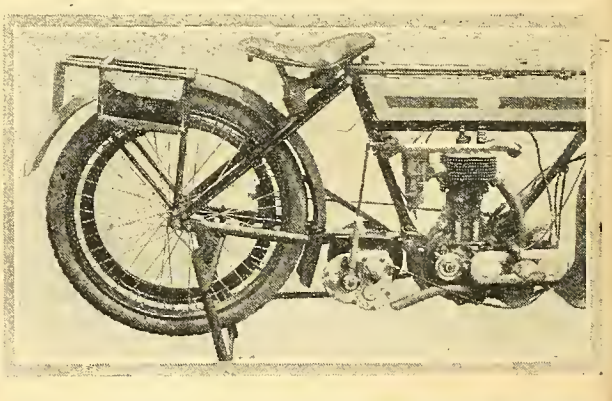
The price is £222 10s. with dickey seat, and a wider model, seating two passengers side by side, and having a third seat at the rear, is also to be marketed for £255, complete with hood, screen, and electric lighting.

The Baughan runabout, primarily designed as a monocar, but capable of taking a second passenger in a neatly arranged dickey seat.



Countershaft Gear Conversions.

FREQUENTLY we are asked by owners of single or hub-geared machines if it is possible to fit a countershaft gear. An answer is supplied by the accompanying illustration of a 1913 hub-geared Triumph, which has been converted for use with a Sturmey-Archer three-speed countershaft gear. Such conversions, it must be noted, however, are not so easily made as might appear.

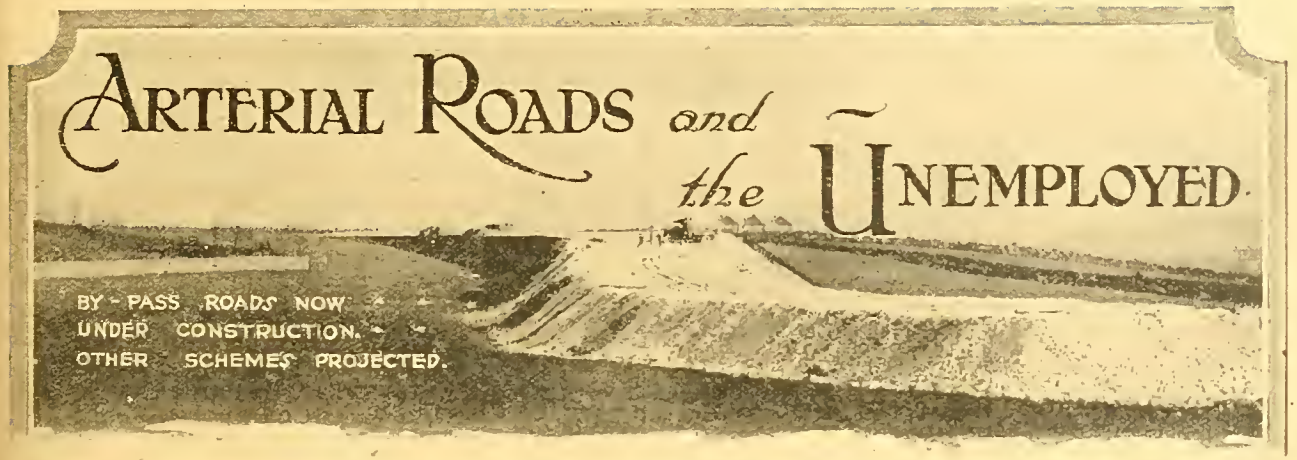


The work was carried out by the Sheldon Engineering Co., of Bailey Lane, Coventry, who specialise in such conversions. Their method includes a new rear portion to the frame, and new wheel as well, of course, and the gear box. Almost any type of machine can be converted for a price in the neighbourhood of £27, though the figure varies somewhat according to the amount of work required in attaching the new rear frame and altering brake gear and controls.

A very substantial bottom bracket lug is incorporated to carry the Sturmey-Archer gear, and plenty of room is provided for adjustment of the primary chain.

During our visit to the firm we were able to examine several different makes of machine which were undergoing conversion, and it may be said that certain forms of frame offer involved problems in the way of modification. So far, however, the Sheldon Engineering Co. have overcome all these difficulties.

Sturdy bottom bracket used by the Sheldon Engineering Co. in their conversion sets.



Rear portion of an early model Triumph, which has been converted from a hub to a countershaft-geared machine by the Sheldon Engineering Co.

MOTOR CYCLES IN SWEDEN.

WE have had a very interesting letter from Mr. Gustav Göthe, a Swedish motor cyclist and enthusiastic reader of *The Motor Cycle*, who gives us some very useful information concerning the motor cycle sport and pastime in his country. He tells us that the Swedish Motor Cycle Club has now developed into a firm and powerful organisation, well-known, and acknowledged in the whole of Sweden. Last year it joined the F.I.C.M. Consequently the Swedish Club is going to make this year's May Trials at Whitsuntide an international affair, and sincerely trusts that British motor cyclists will go over and compete. He says that the Swedes have earned an international reputation for their hospitality, and he promises that motor cyclists who visit his country will have no reason to regret it

Mr. Göthe has studied motor cycle conditions in this country carefully. He is secretary of the Competitions Committee of the Swedish Motor Cycle Club, and tells us that the motor cycle, both as a sporting vehicle and for practical purposes, has gained ground tremendously during the last few years. Before the war motor cycles were comparatively rare, but now they are in use all over the country. He regrets to have to tell us that most of the motor cycles are American, due to the difficulty in getting supplies of British machines after the war. This year, however, he hopes to see an alteration. He is very enthusiastic concerning the qualities of British-made machines.

ARTERIAL ROADS and the UNEMPLOYED

The new road between Purley and Waddon Stations in course of construction.

IT has been known for a long time that steps are being taken to improve the roads in the Metropolis.

The approaches to and exits from London, as many of our readers are aware, are in places dangerous and bethronged with traffic. The construction of new roads, too, is providing work for the unemployed, and consequently some reference to the scheme is of double interest.

We may first make mention of the Eltham by-pass, which will enable traffic passing from London to Maidstone to avoid Eltham High Street. The northern extension of this by-pass will serve as a useful connection between Greenwich and Woolwich. The Shooters Hill by-pass, which is four miles in length, will branch from the Dover road at Blackheath so as to avoid the 250ft. climb over Shooters Hill, rejoining the Dover road at Welling. Two circular roads are also projected one in the south through Woolwich, and one in the north through Willesden, Edmonton, Walthamstow, etc., both of which will allow the congested centre of the city to be avoided.

The western avenue through Hammersmith and Acton will, it is hoped, continue through Ealing and Greenford, and will join the Oxford road beyond Uxbridge. The eastern avenue will traverse the marshes of the Lea through Hackney and Leyton, and will cross the Lea valley between the Bow road and Lea Bridge road. It is hoped that this avenue will eventually be prolonged through Wanstead and Ilford, and join the main Colchester road beyond Romford, forming a road from the north of London eastwards without going through Whitechapel, Bow, and Stratford.

There is yet another scheme which concerns the new Cambridge road through Tottenham, Edmonton, and Enfield, rejoining the old Cambridge road after Cheshunt.

Modern Motor Ways.

The Ministry of Transport contemplates the construction of highways of at least 100ft. between fences. In the case of the 100ft. road there will be an 8ft. footpath next to each fence. On each side of the footpath a 5ft. grass track and a 3ft. gravel strip between it and the 24ft. carriage-way. Next to the carriage-way will be a 20ft. track for fast traffic or tramways. Beyond the 20ft. track will be another 24ft. carriage-way similar to that on the other side of the central track.

At the present moment the intention is to prepare the roads roughly throughout their full width, and only to complete the footway, grass track and narrow strip, and one of the carriage-ways, which will have a 6ft. footpath on the right-hand side. The remainder of the roads (54ft.) will probably be let out in temporary allotments pending the time when they can be completed. Other roads will have to be of smaller dimensions

This gives briefly an idea of the work on which the unemployed are being engaged, and it is interesting to note that preference is being given to ex-Service men.

Ten Millions for Roads.

A sum of ten million four hundred thousand pounds is to be made available for distribution for new road construction by the Ministry of Transport, and of this sum five million two hundred thousand pounds form a fund from which further grants towards road schemes can be made, while a similar fund is available for roads at Government rate of interest. Half of the largest sum is being allocated for the Metropolitan area, and the balance for arterial road schemes in other districts. Not less than 50% of the cost is to be expended on wages for unskilled men.

So far the Minister of Labour has sanctioned expenditure in thirteen areas inside the Metropolitan area and sixty-six areas outside the Metropolitan area. In the Metropolitan area the county councils have been approached and pressure has been brought to bear upon them to undertake the necessary work with a 50% grant and a 50% loan, but so far the councils have agreed only to undertake a small portion of the work. When there is any excessive degree of unemployment in any particular district the Ministry of Labour notifies the Minister of Transport, whereupon the latter communicates with the local authorities so as to ascertain whether any road construction schemes are in existence in that district. The amount offered to the local authority is based on the number of unemployed ex-Service men in the area concerned.

Thousands of tons of chalk are being conveyed by lorries to raise the foundations of the road to the required height.

Prices of Second-hand Motor Cycles.

A Schedule of Prices at which used and shop-soiled Motor Cycles were being offered in the miscellaneous advertisements of last week's issue of "The Motor Cycle."

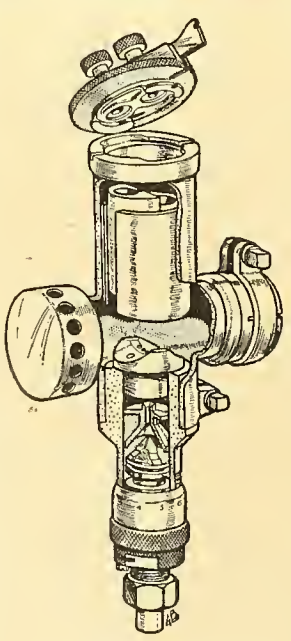
A Floatless Carburetter.

The Parmor Vaporiser—a Well-made Instrument embodying Several Novel Features.



EVER since the introduction of the spray carburetter a certain number of designers have given their minds to the problem of eliminating the float and its attendant mechanism. We have before us a recent example of floatless carburetter, which embodies several features of interest, and which has been tested by a well-known Midland firm with satisfactory results.

This instrument is known as the Parmor floatless carburetter, and is marketed by Parmor Carburetters, Ltd., Carlton House Extension, Birmingham.

Graduated Adjustment.

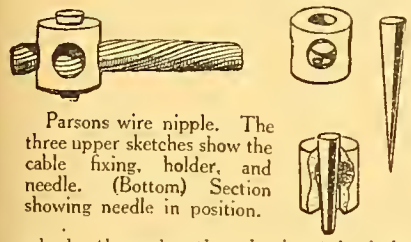
Petrol is fed directly to one or more small jets drilled in the face of a wide cone. When at rest these jets are sealed by an internally-coned valve which takes its seating on the surrounding face. This valve has a vertical hole drilled through the centre and lies immediately below a series of spraying jets. By means of a milled cap the height of the main coned member may be adjusted, thus regulating the permissible travel of the valve. The cap is provided with a scale and a locking device, so that once the correct adjustment has been found it may be retained indefinitely, or modified to suit existing conditions. It will be clear that engine suction will raise the jet covering valve and thus allow petrol to pass to the atomising jets.

Air and throttle barrels are of normal construction, the former being D shaped and sliding within the latter, while the cap of the carburetter is secured by a bayonet joint locked in position by a simple spring clip. At the present time the carburetter is made for "big singles" only, though further models are under way.

Part sectional view of the Parmor floatless carburetter, showing the conical jet and its covering valve.

Advantages Claimed.

Since a Parmor carburetter is in the course of being fitted to a staff machine we will confine our description to this brief outline of the instrument with a view to giving our actual experiences on the road at an early date. We may state, however, that we have seen reports from competent and independent sources which state that the carburetter has given excellent results as regards power, flexibility, and consumption, and that there are no symptoms of drip when the machine is at rest. The main claims of the manufacturers are: easy starting, low consumption, great flexibility, and prevention of "konking."



REVERSE GEAR ON SIDECARS.

EXHIBITED at the Amsterdam Motor Cycle Show there was a four-cylinder Henderson fitted with a reverse gear. Such equipment seems unnecessary complication and cost.

The majority of sidecar outfits can turn in their own length, but there are exceptions, and to the makers of these we recommend that they increase the wheel lock. We do this, not because we think there is the remotest possibility of them considering a reverse, but because no sidecar outfit should require the full width of the road in which to turn.

A BOWDEN WIRE NIPPLE.

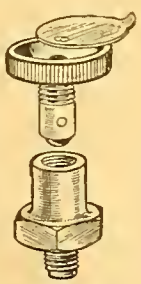
AN ingenious and effective method of fitting a Bowden wire has been introduced by Mr. L. Parsons, 277, Ley Street, Ilford, Essex. The nipple is made of brass, and through it is a hole drilled eccentrically. A further hole is drilled through below this, and still another, which does not quite penetrate the nipple, at right angles. The end of the wire is first sweated and then

Parsons wire nipple. The three upper sketches show the cable fixing, holder, and needle. (Bottom) Section showing needle in position.

pushed through the horizontal hole, while an old gramophone needle is next driven through the vertical hole. The effect of this is to force the wire upwards into the hole partially drilled through the nipple, thus securely anchoring the cable. The method appears to us to be quite good, and should be entirely satisfactory.

A SELF-HEATING SOLDERING IRON.

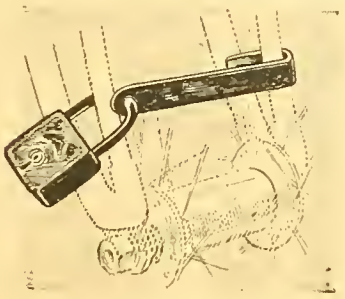
A SIMPLE and ingenious soldering iron, heated by methylated spirit, is handled by Gordon Uren, 11, Rue Descombes, Paris (XVIIe), France. Known as the Ki-soude, it will certainly



A French self-heating soldering iron.

appeal to those motor cyclists who do their own repairs. Filled with a pennyworth of methylated spirit, the iron will keep hot for half an hour and should prove very useful to the motor cyclist for small repair work.

A PRACTICAL COMPRESSION TAP.



AN ingenious motor cycle compression tap has been produced by Messrs. Ross, Courtney, and Co., Ltd., Ashbrook Road, Upper Holloway, London, N.19. It is made in two portions, a main body screwed into the cylinder and a detachable portion fitted complete with dust cover and terminating in a steel ball which engages with the seating of the main body. The design of the tap should prevent all leakage, and should be entirely satisfactory for ordinary use.

The Ross-Courtney dust and compression tight injection tap.

A SIMPLE LOCK.

A MOTOR cycle lock which is none the less secure despite its simplicity is marketed by Messrs. H. Taylor and Co., Ltd., 21a, Store Street, Tottenham Court Road, London, W.C.1. It consists merely of a piece of flat steel bent into the shape of a hook with a hole at the opposite end. The hook is

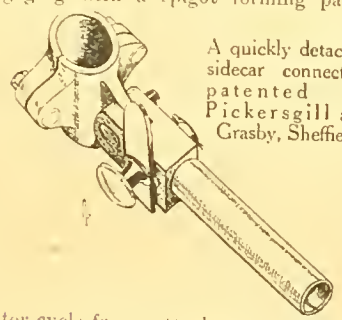
Taylor's simple motor cycle lock.

passed round one member of the front forks, while the other end is secured to the opposite side by means of an ordinary padlock, the hasp of which is slipped through the hole. In that position the motor cycle cannot be wheeled, and it would take an expert thief some time to cut through the steel bar with a hacksaw.

A FLYWHEEL BRAKE.

IN our pages of readers' ideas the suggestion of a flywheel brake has often arisen, and lately Messrs. James Grose, Ltd., 4, Old Jewry, London, E.C.2, have submitted to us a sample brake, which may be used on Douglas motor cycles as well as on many other machines provided with outside flywheels.

Grose's flywheel brake for Douglas and other outside flywheel machines.

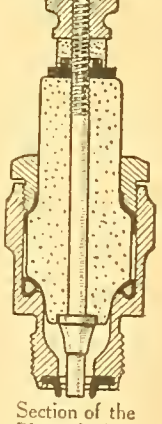


The same firm also handle a comfortable foot muff for sidecar use, which should be specially welcomed by lady sidecar passengers at this time of the year.

A foot-muff for sidecar passengers It is made by J. Grose, Ltd.

A QUICKLY DETACHABLE SIDECAR COUPLING.

ANY device which will enable a sidecar to be quickly detached must, of necessity, be welcome. A coupling designed with this end in view has been produced by Messrs. Pickersgill and Grasby, 237, Attercliffe Common, Sheffield; it is known as the Quick clip, and consists of a lug in which a slot is cut engaging with a spigot forming part of



A quickly detached sidecar connection patented by Pickersgill and Grasby, Sheffield.

motor cycle frame attachments. When the slot is engaged with the spigot a taper pin is pushed through; the pin is then covered by means of a slide which, when twisted into position, fits close up against the countersunk head of the pin and prevents it from moving. The slide is fitted with a self-locking device which renders the coupling absolutely secure.

A PLUG TEST.

WE have had under test for the last two or three months a couple of new type plugs, manufactured by Messrs. Bluemel, Ltd., of Wolston. These have been given a very hard test on a big twin sidecar outfit, and have stood up to many severe gruellings on the road when long bursts and fast speeds have been indulged in. The mileage done with these plugs has been about three thousand, and the fact that we intend to retain them in use for the future is sufficient evidence of their excellent qualities.

Section of the Bluemel plug.

The only alteration which we made to the plugs as sent out by the makers was to widen the gap slightly, otherwise they have been untouched since they were first put into the engine. A sectional view of the plug is illustrated herewith.

IMPERIAL MOTOR TRANSPORT CONFERENCE.

Copies of the report of the proceedings of the Imperial Motor Transport Conference held at Olympia in October are now available at a charge of 8s. 6d. (post free). It is obtainable from the hon. secretary to the Council, Mr. Horace Wyatt, Royal Automobile Club, Pall Mall, S.W.1.

WEIGHT AND PRICE.

How a Weight Limit Encourages the Moderately-priced Cycle Car.

THERE has always been a difficulty in deciding on a dividing line which will distinguish between the cycle car and the miniature car, and so long as engine capacity alone is used for the purposes of identification this difficulty is bound to exist. Whether the limit be fixed at 1,100 c.c. or any other arbitrary figure, both air-cooled radial and four-cylinder water-cooled line ahead engines are included, while if price is chosen as a basis, one is apt to find certain American productions which can hardly be described as cycle cars included in the definition. Let it be stated here and now that there is obviously no objection to the standard line ahead four-cylinder engined cycle car *provided the initial cost and running expenses can be kept low enough to compete favourably with a high-class motor cycle and sidecar.*

The whole crux of the situation appears to lie in the fact that the successful cycle car must compete equally with the more luxurious sidecars.

Effect of Weight Limitation.

And now to explain how a suitable weight limitation will ensure this desirable end. There will be few who will deny that weight is one of the most important factors in upkeep, granted, of course, the machine is strong enough to be roadworthy. Weight also has a great bearing on the question of initial cost provided, again, that the machine is designed and not guessed at. Let us examine the question briefly, commencing with the all important power unit.

For the purposes of this article all types of engine likely to be used at the present time, V twins and flat twins, will be henceforward referred to as "radials," since it is obvious that the former is the simplest form of single line radial, and the latter the simplest form of two line radial (radials with cranks in more than two places are not worth considering at the present moment).

It must be obvious to the average intelligence that a single line radial is the lightest and cheapest form of engine for a given number of cylinders, since it involves only a single throw crankshaft of such short length that it can be made sufficiently stiff with a minimum of weight and machining. (Against this must be set the necessity for balance weights which, however, are easily constructed.) A short crank case also with the minimum of metal is required, and if an outside flywheel is used, the castings will weigh but a few pounds. Both crankshaft and crank case will cost proportionately less than the long shaft and case of the conventional four-cylinder, which must be made unduly heavy in order to attain the necessary amount of rigidity.

The radial has another very great advantage in that, being short in itself, it enables the chassis to be shortened without reducing the seating accommodation. At first sight the advantage thus gained is not so obvious, since few of the non-technical public realise the amount of extra weight involved by the addition of 6in. to the wheelbase. Such lengthening increases the weight, not only by the extra 6in. in the frame and drive length, but also if the frame has been correctly designed in the first instance by a considerable increase in the depth or section of the frame members, and possibly of the propeller-shaft. It is true that a long wheelbase provides additional comfort at speed, but if the seating accommodation is kept well within the wheelbase and the springing is well carried out, the difference is not likely to be very noticeable.

So far, no mention has been made of the respective merits of air and water-cooling, but the air-cooled engine obviously scores in the matter of both price and weight, though in the latter respect the difference in the near future is not likely to be so great as might be expected, since designers are beginning to realise that to obtain the best and most even cooling, a considerable mass of metal is required in air-cooled cylinder castings. (The use of aluminium and composite cylinders is not contemplated on the score of increased cost.)

Since the engine and chassis will be considerably lighter in the case of the air-cooled radial, the springs, axles, and tyres can be made lighter, thus again reducing the cost of material and a very important factor, unsprung weight.

Saving Production Costs.

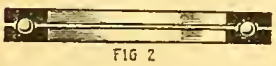
Now if an air-cooled radial engine is designed so that both (or all) the cylinders are identical, the combined saving in weight and cost is going to make a considerable difference in the first cost and upkeep of the machine, and the car type engine will have its time cut out to compete with the less orthodox type.

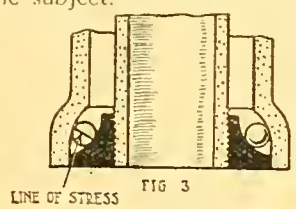
It is hardly in the province of this article to deal in detail with the most suitable type of air-cooled radial, but it is to be hoped that sufficient has been said in explanation of the fact that, given suitable weight limit, the car type with its greater initial price and upkeep will be automatically excluded from the true cycle car class. If, however, a true and roadworthy light car can be built within the limits of, let us say, 1,100 c.c. and 8 cwt. complete, and still appeal to the prospective cycle car buyer with a low price, it deserves all the credit that it will undoubtedly earn.

STEERING HEAD BEARINGS.

Some Notes on an Important Item of Design.

A LETTER published in *The Motor Cycle* of December 2nd brings home to me the fact that a little more explanation and fuller details should be added to my remarks on bearings and their adjustment in the series of articles intended for novices. Let me say first that on many points I am in agreement with the writer of the letter mentioned whose connection with the Skefko Ball Bearing Co. naturally suggests some knowledge of the subject.





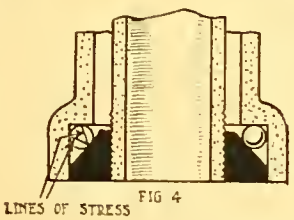


Fig. 1.—A conventional thrust bearing.
Fig. 2.—A more suitable type of thrust race.

Figs. 3 and 4.—Adaptation of cycle wheel bearings applied to the steering head, as suggested by our contributor.

There is probably much difference of opinion as to the desirability of journal bearings for motor cycle wheels. Doubtless they will run with less friction than the cycle bearings usually employed, and if Skefko or other double row ball bearings are used there will be no question of their not being up to their work on solo machines, but they have the disadvantage of not being adjustable, and I think they have still to prove their worth on sidecar outfits. The Timken taper roller bearings are excellent for this purpose, provided that dirt can be rigidly excluded.

The Best Bearings for the Head.

It is, however, on the matter of the head bearings that I differ from Mr. Walker (whose letter appeared in the issue for December 2nd). The usual thrust bearing would not do at all, and it is only by deepening the cups that the bearings can be even reasonably efficient (see figs. 1 and 2). Even when the cups are deepened the wear takes place principally on the edges of the cups rather than at the bottom, and there must come a time when the depth of the cups is insufficient to allow of enough adjustment to take up the lateral movement.

Suppose fig. 5 to be a diagrammatical representation of the front part of a motor cycle having a rake of 30° from the perpendicular. Let the line through the centre of the head produced meet the ground at the point of contact of the tyre. Now, if the top of the head be 36in. from this point, the head 6in. between the bearings, and the load on the front wheel 100 lb., we obtain the following figures (see fig. 6). The resistance of the road (R) will be equal to the weight on the front wheel (100 lb.), and will act vertically upwards. This force can, by means of the parallelogram of forces, be resolved into two component forces acting at right angles, one directly through the steering head, which will represent the force with which a thrust bearing can cope; the other at right angles to this, which will represent the force for which journal bearings are best suited. The angle R C B being 30° we have now a triangle equal to half an equilateral triangle, and the sides will be in the proportion of 1, 2, and $\sqrt{3}$. This gives a force of 86.6 lb. acting directly through the head as a plain thrust, and a force of 50 lb. acting at right angles to the line of the head at C, the point of contact with the ground. We will take the distance between the head bearings A B as 6in., and the distance of the top bearing to the point where the wheel touches the ground A C as 36in. If we suppose for a moment that the head can swing about A, the force at B, the lower head bearing, for which a journal bearing is required, is 300 lb., for A C is a lever of the second class.

A Compromise.

Thus we have in the lower bearing 86.6 lb. suited to a thrust bearing, and 300 lb. suited to a journal bearing. Hence I maintain that a combination of these bearings is necessary for complete efficiency. Considering the top bearing in the same way we find that the thrust is equal to nothing, for the weight is only pressing the bearings apart, and the radial force 250 lb. in the opposite direction to the same force at B.

Failing a combination of thrust and journal bearings I am in favour of such bearings as that used on cycle wheels (fig. 3), or that shown in fig. 4. Where the balls touch at two points only the line of stress must pass through these two points and the centre of the ball, and in cycle bearings this line can be set in the most suitable direction for withstanding the various forces by a proper arrangement of the curves in the cups and cones. Fig. 4 shows a three-point bearing, and the lines of stress for the radial and end thrusts will be situated in different parts of the ball. Neither will be quite as good as separate thrust and journal bearings, but both will serve their purpose if properly and carefully designed. J.H.W.

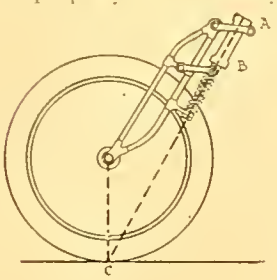

Fig. 5.

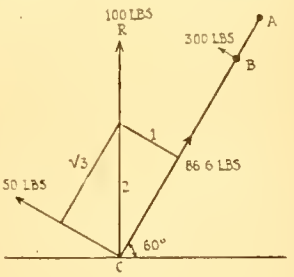

Fig. 6

WINTER WEAR

by ROAD RIDER

The motor cyclist on the left favours a woollen cap, a long rubber coat, and a pair of Hamel's "quick-fastener" overalls tucked inside snow boots. A leather helmet is worn by the other, who, having efficient leg guards, does not trouble to wear "extras" on his lower limbs.

Some Notes of Clothing for Head, Body, Hands, Legs, and Feet.

ONCE more the audacious motor cyclist who does not put away his machine with his cricket gear in September is obsessed by the problem of keeping warm and dry. As one of that pugnacious class who consider no weather too inclement for their favourite hobby I propose to set out a few precious maxims bought in the hard school of experience and suffering. In order to maintain some sort of logical sequence these notes shall commence at the rider's head and work gradually downwards.

Head Gear.

A weird assortment of hats and caps may be viewed at the start of a London-Exeter, but riders for whom every winter day is an instalment of a continuous London-Exeter will perceive immediately that two-thirds of the entry are badly dressed. The obvious first essential is to keep the ears warm. Rolls and flaps are used for the purpose. Rolls facilitate hearing, but do not make for warmth at low road speeds in a side wind. Flaps are certainly preferable except in very heavy traffic. Oddly enough, the *forehead* feels cold more readily than any part of the head except the ears, and the cap or helmet should be thickly padded in front.

Helmets are all very well, except that they do not protect the eyes. In blinding snow or a hailstorm anybody's eyes need protection, and goggles cannot be worn. In an icy wind most men's eyes are apt to stream with water; as a cure goggles may be worn if the air is clear; in this case the goggles should not be lowered over the eyes until 100 yards after starting, or they will mist. Eye protection in snow or hail is not provided on any storm cap of my acquaintance; a stiff peak (*e.g.*, with an aluminium liner) resembling that of a jockey's cap is required.

I use two types of headgear in winter, viz.:

1. A waterproof flapped helmet by Shekman, of Tyne Dock, which is excellent, except that its peak is flabby and soft. With a stiff, long peak it would be fine. In fair weather it can be furled up into the sort of cap once known as the "polo" type, but now associated with Bolshevists.

2. A seafaring man's headbag with face-hole and neck skirt, for which see below.

A storm cap made by M. Shekman and Co., of Tyne Dock.

Neck Gear.

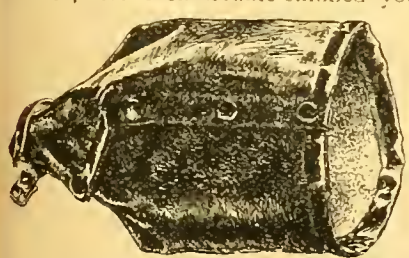
The blazing crime of nearly all motor cycling coats is that they do not seal the gap round the neck against the entrance of rain. Tailors doubtless imagine that the seal is perfect. So do riders until they venture out. Then they wind long soft scarves round their necks, and in half an hour the sodden feeling becomes miserable, and an Alpine rivulet trickles between the shoulders. Good motor cycling tailors like Irvine Smith find it necessary to sew a protective flap along the buttoned front of a jacket to stop rain blowing in; from which it can be imagined that the problem of a dry neck is acute in really bad weather. I believe Dunhill has a poncho-necked coat drawn

Two of Barbour's (South Shields) specialities mentioned by our contributor—the Blizzard helmet and oilskin mitts.

Waterproof twill gauntlets with hide palms—speciality of Dunhills.

Combined mitts and gloves as supplied by Dunhills to the troops in Russia.

tight by a string. I have never tried it, and the old "umbrella neck" of elastic rubber is the only waterproof neck I know. Since umbrella coats became unobtainable, I have relied on the enormous oilskin bags in which sailors encase their heads. Barbour, of South Shields, makes a good one. The chief merit of such bags is that they have an ample skirt, which overlaps the coat collar; so they shoot water off the head on to the shoulders, and the shoulders shoot the wet off on to the road. But they are ineffably hideous. Bold as I am, I dare only wear them in the dark, or in districts where I am unknown.



Failing such a head-bag, the best plan is that usually followed. Get a coat cut to fit your neck as closely as possible, and caulk the joint with many wrappings of a soft scarf.

The Coat.

Leather for warmth and oilskin for "dryth" is the old motto. Nothing but a thick, close-textured stuff like leather will ward off winter winds at motor cycling speeds. Put on as many undercoats as possible, one of which should either be leather or solid rubber sheeting; and cover the lot with a genuine waterproof, such as a Beacon oilskin. Windcuffs are not necessary, as gauntlets will certainly be worn. Barring the difficulty of the neck, emphasized above, the coating is perfectly simple, and is merely a matter of quantity. A belt, of course, is essential, or the draughts work up from beneath, and make you feel as the emperor of the fable did in his new clothes.

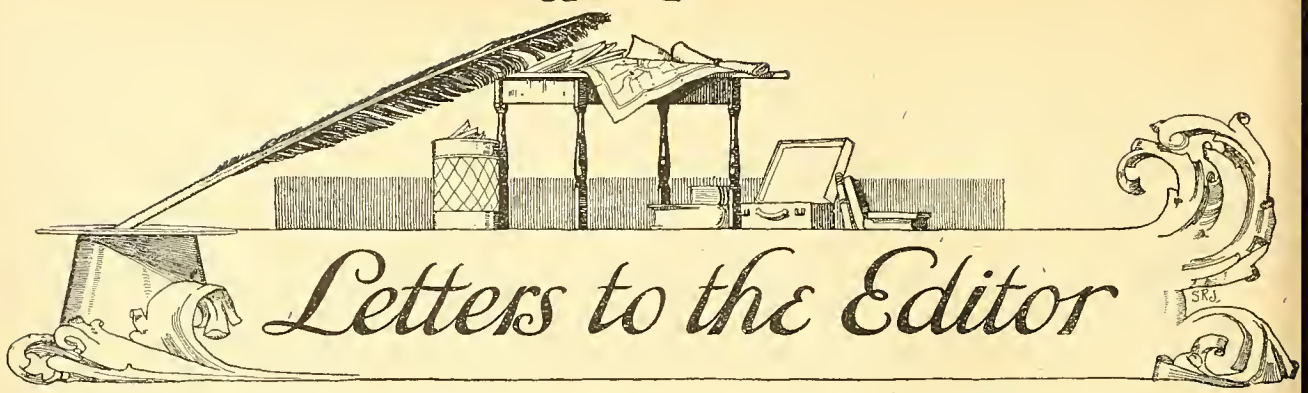
The Hands.

Hand-comfort hinges on circulation. Nobody can keep his hands warm indefinitely on a motor cycle in winter, not even double-skinned youngsters, such as G. P. Mills was in his prime. Any of us can start a ride with his hands warm, and cover his hands with non-conducting materials, which will retain the starting heat for a variable period. A man with a bad circulation may have to stop and warm his hands at a fire or by performing physical jerks within half an hour. A man with a good circulation can keep going for an hour or two. The desirable accessories are:

Wool-lined waterproof handle-bar muffs by the Cameta Rubber Co., Birmingham.

1. Handle-bar muffs. (Essential in Arctic weather and long distance work.)
2. Two or three pairs of thin, soft gloves (silk or wool).
3. An overall glove which is both wind and waterproof.

I agree with my colleague "Ixion" that the German "Continental" glove has never been equalled. I am now using in its stead a pair of mitts made for the Archangel field force, warmly lined and finished in waterproof twill. I also possess a pair of gloves on similar lines by Dunhill, and a pair of Beacon oilskin mitts.



The Legs.

Leggings come in the same category as coats. Almost anything will do. If we except one detail, leggings are more a matter of quality than quantity. The exception is the spats. Ninety-nine leggings out of every hundred are spatted. The spats are cut to fit an ordinary boot. One pair of walking boots spells frostbite in real winter motor cycling; but if the feet are properly clad, the spats won't fasten over the feet. Ergo, the winter rider must eschew shaped and spatted leggings and wear trousers. His exact specification for leggings will thus vary according to what he intends to wear on his feet. Later on, as the weather gets worse, I shall appear in a pair of knee gum boots, which are the warmest boots ever made, but need careful precautions to prevent water running down into them. So when I don the gum boots, I wear oilskin trousers right over them, and strap the hems of the trousers round the ankle to prevent them singeing on the engine or catching in spiky parts of the machine.

The College "foot overall," which is adjustable, and has a leather insole and waterproof outsole.

A regular wardrobe, you say, gentle reader? Certainly. But without, proper winter motor cycling ceases to be a pleasure, and ranks rather as a graveyard filler.

Letters to the Editor

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

CROSS ROADS RIGHT OF WAY.

Sir,—I have just read in your paper that nothing has been embodied in the new recommendation of the Ministry of Transport to indicate a prior right of way at cross roads.

I beg to suggest that the "cross roads" sign visible to a driver should indicate that he has prior right of way when the sign is in black lettering, and against him when in red lettering. It would cost no more, and it is just as easy to do the right thing at the commencement.

A. W. BAILEY.

A SUBSTITUTE FOR TROW HILL.

Sir,—As you say in your description of the London-Exeter, Trow Hill seems to have lost its old terror for motor cyclists. I also think so. I can climb it on my 2¼ h.p. Radco, and when the hill is quite dry I can get up on top gear on my two-speed 7-9 h.p. Indian.

As a "new venture," why not bring before the M.C.C. Committee Chine Way Hill between Ottery and Lyme Regis? It would not be a single mile out of the way (rather less than the Trow Hill route if anything).

I admit this hill is only about the same gradient as Trow, and it has no corners, but it invariably has a very loose surface, and would be just as likely to cause failures as Trow (if not more so). I merely mention this as a keen motor cyclist, but, perhaps, it might receive the attention of the M.C.C. Committee, if they were to hear of it.

RICHARD SHEPPERD.

TWO YEARS ON A SOLID TYRE.

Sir,—I was pleased to note "L.J.G.'s" query *re* solid tyres in your issue of the 6th.

I have been riding for the last twenty years, and although engines have improved vastly in the meantime, pneumatic tyres have not, and, until we can afford to fit Rapsons, we are still subject to the puncture bugbear.

To avoid this, I have used a solid tyre on the driving wheel of my 2½ h.p. motor cycle for the past two years with great success. It may slow the machine a trifle, but it certainly makes for peace of mind, and the worst and flintiest roads have no terrors!

It is made by the British Airless Tyre Co., Ltd., cost about 57s., and was obtained from the local agent of Curry's.

H. S. CHARLTON.

A.C.U. AND CYCLE CARS.

Sir,—As a more than satisfied owner of a Tamplin cycle car, I welcome the proposal of the A.C.U. to take over this type of vehicle from the R.A.C. This little car is a motor cycle on four wheels pure and simple, with 8 h.p. a.c. engine, S.A. three-speed gear box, belt and chain drive, and motor cycle wheels and tyres; and, in my opinion, it is absurd that such a machine should be classed with pukka light cars of four times the weight and cost. There is an immense future for the true cycle car if developed on the right lines, and I entirely agree with you that it is only by competition and comparison with the sidecar and three-wheeler that this can be brought about satisfactorily. At the same time, I think the utmost care must be used in striking a dividing line, and would suggest that weight is even more important than c.c. If these were fixed at 8 cwt. and 1,000 c.c. respectively there could be no genuine argument against control by the A.C.U., and it would remove the absurdity of such cars as the Singer, Deemster, etc., being classed as cycle cars and compelled to compete with motor cycles and three-wheelers.

Further, I feel convinced that once the true cycle car is under A.C.U. control, future taxation will be based on the same basis as three-wheelers. Under present taxation the monocar and light two-seater cycle car are doomed, and I am surprised that those who are supposed to represent the type do not appear to realise this? TAMPLINITE.

Birmingham.

A.A. SUBSCRIPTIONS—ANOTHER VIEWPOINT.

Sir,—I am in full sympathy with "An Ungrateful Member of the A.A" regarding his comments upon the increased cost of everything connected with his motor cycling; but in regard to his objection to the increased subscription for A.A. motor cycle members, may I put him right on one point?

The A.A. made very stringent efforts to get the new tax reduced, and in my Minority Report on this taxation I laid particular stress upon the cases of the large number of motorists who, by force of circumstances, use their vehicles occasionally, or at week-ends. I had in view the case of the worker who, like "An Ungrateful Member of the A.A.," could not afford to let his motoring, amounting only to a few hours each week, cost much.

Because the A.A. did everything possible to prevent the imposition of this tax, and intends to continue its fight, your correspondent, if he is really anxious to see a reduction of motor taxation, should continue to support us. A fight cannot be maintained without a war chest, and "An Ungrateful Member of the A.A." and his friends should realise that by cutting out their membership of the A.A., they are capitulating to the enemy, and that in these circumstances conditions will certainly not improve, but are likely to become worse.

STENSON COOKE,
Secretary the Automobile Association and Motor Union.

T.T. ENTRANCE FEES.

Sir,—Some time ago one of your correspondents pointed out the desirability, nay the necessity, of a reduced entrance fee for the genuine "private owner" in this year's T.T. Probably owing to the length of time which then existed before the event became reasonably near, the epistle did not attract the attention it deserved. With the race now less than five months distant, however, it is time to make a protest against the excessive high fee of £21 which, I understand, has been settled for trade and amateur riders alike. A private entrant should certainly not be called upon to pay such a high penalty for what is, after all, only a sporting run, from his point of view. The private owner's chances of success are naturally 100 to 1 against the trade rider's. A fee of £10 is certainly high enough for him. Such a fee is "solid" enough to prevent any overcrowding.

It might also be pointed out that incidental expenses in connection with the T.T. are greater than those of any other competition or trial in England. The trade and the locality where the event takes place stand to gain more by this event than by either of the English or Scottish Six Day Trials. Nevertheless, though the first event occupies only a single day (for each competition), the fee charged for entrance is six or seven times greater than that required for an event of a week's duration. RICHARD McAULEY.

MECHANICAL OIL PUMPS IN COLD WEATHER.

Sir,—I must beg leave to disagree with Mr. David Todd in his diagnosis of the trouble in lubricating motor cycles mechanically during cold weather. I submit that the size of the pump makes no difference to the draw or pace exerted on the oil. This is a question of elementary hydrostatics.

As a matter of practical experience, I was recently able to observe the behaviour of the Best and Lloyd mechanical pump which I have had fitted to my Matchless since last August. It must be admitted that on one or two mornings during the month of December the temperature was as low as is generally experienced in this country during winter. I was therefore rather surprised to notice that there was no check on the action of the pump and apparently no lessening of the oil supply. F. J. NESBIT.

MOTOR CYCLE TAXIS AND THE NEW TAXATION.

Sir,—Some uncertainty has existed as to the position of motor cycle taxis under the new taxation, and it was thought that they would be classed as hackney carriages, and thus be liable to a tax of £15, which would be a serious blow to this new development of the motor cycle industry.

With a view to obtaining an authoritative statement, we waited upon the chief taxation officer for Birmingham, and were informed by him that, under the "Roads Bill" now passing through Parliament, it is definitely stated that "where a hackney vehicle of the class mentioned in pars. 1 or 2 of the second schedule to the Finance Act, 1920, it shall be charged with duty under par. 1 or par. 2, as the case may be, and not under par. 3 of that schedule."

Par. 1 refers to motor bicycles with right to draw sidecar or trailer, weight unladen not exceeding 8 cwt., £4.

Par. 2, tricycles not exceeding 8 cwt. unladen, £4.

Par. 3, motor hackney vehicles, £15.

In view of the importance of this point to your readers, may we ask that you will give it prominence?

THE COUNTY CYCLE AND MOTOR CO.,
FAWKENER BIRCH.

SOME MORE DOUGLAS LUBRICATION HINTS.

Sir,—Referring to Mr. Cecil Emery's letter in a recent number of *The Motor Cycle*, I would strongly advise against the use of soft solder in the main oil lead of the 4 h.p. Douglas.

When my machine was first taken down after 2,000 miles there was no trace of carbon or oil in the rear cylinder, the cause being a blob of solder in the pipe. Whether this was due to careless soldering of the joints or an endeavour to restrict the bore I cannot say. What I have done is to cut the oil pipe below the T joint and solder in a small brass tap. The oil supply is now under absolute control from the saddle.

With regard to petrol consumption, I am now getting 75 m.p.g. with a Binks, with sidecar and passenger, and, having just fitted a hot air pipe, I hope to improve this as the engine now takes full air on a No. 1 second pilot jet with Aviation. SOUTHCOMB MAY.

TO SAVE SHOE LEATHER!

Sir,—For many moons past, I have been a humble neophyte in the motor cycle world, studying your invaluable columns and hoping that some rich uncle would die and do the necessary. To my unbounded joy, I recently acquired an ancient grid, wherewith I have considerably startled the villagers (and myself).

Tongue cannot tell, nor pen delineate, the joy of roaring up hills (quite frequently), merely by waggling a lever, instead of pushing the wretched pedals round, as previously. Exquisite the pleasure, until it was painfully borne upon me that there is no unalloyed bliss on this unfortunate planet.

I have come to the conclusion that the plague of mankind is (or are) dogs. Millions of them! Whether it is my rowdy exhaust or merely my homely countenance, I know not; but no sooner do I set forth, than I am beset by pups. Hounds of birth and curs of low degree, the butcher's mastiff and the grocer's dachshund all seem bent on hari-kari in my front wheel. Not that I am disobliging, really, but old ladies scream so, and "bobbies" have an unfortunate habit of flourishing note books.

I had thought of a sort of miniature machine gun swivelling on the handle-bars, capable of shooting tin-tacks, but the thought of the tyres following after deterred me.

In my less lurid moments, I bethought me of an excellent remedy—a veritable cerebral undulation! Observing the joyful bang of a disused electric bulb, I wondered if this could be developed. Why not have a number of very thin glass eggs, full of "negative pressure," carried in a soft-lined bolster on the tank? One of these, discreetly dropped in front of a bellicose tyke, should give it pause, not to say shatter its morale.

I have even thought out a scheme (all rights reserved) whereby the eggs could be dropped into a flannel-lined exhaust-pipe (by means of b.w. control), to be projected with terrific force against the unhappy canine nose. They could be made of such thin glass that they would disappear in dust, on impact, and, of course, would cause no lasting harm to the offending poodle, except, perhaps, shell shock! If any accessory dealers would care to take the matter up I should be glad to confer such a boon on my fellow handle-bar clutchers. BOW-WOW BANG.

Edinburgh.

A meet of the Hertfordshire Hounds at Ayot St. Lawrence. Local motor cyclists reveal an interest in horseflesh and a rival sport.

B7

SPORTING OR SCIENTIFIC TRIALS.

Sir,—In the past our Six Days Reliability Trials have been fairly sporting for the riders who participated in them, and, as a competition rider, I wish to point out, in all good spirit, that by killing the personal element in competition riding and by making six days events duller for the rider than they have been hitherto, we are inevitably hastening the doom of the reliability trial, which I, and I believe all sportsmen, would sincerely regret.

In the past the few bright spots in our English Six Days have been the freak hills. The Scottish Six Days is always bright, on account of the ever-changing scenery and the general spirit of good sportsmanship which pervades it. I suppose the time has come when the competition rider is the last man to be entitled to voice his opinion. He is merely a puppet, and it remains for others to pull the string. Perhaps the following of the rules of the game without question or quarter is half the sport of modern competition riding. I believe it is. We succeed or we fail. We curse, or we grin. Always we endeavour to be Bohemianly cheerful, while others decide our fates. But as one who occasionally rides as a trade rider purely for sport I cannot help but comment on the A.C.U. project for next year's Six Days. Apparently, it is to be a deadly monotonous affair for those who participate in it. It is to be scientific rather than sporting; but does the A.C.U. realise that the British public is sporting and not scientific? It will follow and remember the results of a sporting trial. Such a trial will influence the public, but the scientific trial will leave the latter cold and unmoved.

Also what is the matter with the mountain track and river bed variety of trial? Has the good machine ever failed to show up in its true colours, or the dud to go under? The "trial of destruction" is the only kind which shows the public what a machine is capable of enduring, and though some of the ideas in the new scheme are good, I do not think that freak hills, etc., should be excluded.

If the A.C.U. carry its present scheme into effect we must look to our Scottish friends even more than hitherto. It will be left to them to retain the sport of the pastime in the competition world. Now is their chance. I sincerely hope they will grasp it. H. MORTIMER BATTEN.

Sir,—I was very much surprised to see a clause in the A.C.U. ruling of the 1921 Six Days Trials which says that all motor cycles of over 350 c.c. will be required to be fitted with sidecars.

One imagines the reason for this to be the development of the sidecarette; but surely it is, at the same time, a hit at the small, but important, portion of the community who favour the sporting single gear machine of 500 c.c., such as you often uphold in your valuable paper. They may be a minority, but are usually the enthusiastic element who do more to uphold the true sport of the pastime than any other portion of the community.

It is such riders as these that know their engines inside out, and interest themselves in keeping their machines in perfect tune—so different from a great and apparently increasing number of present-day motor cyclists who drive a machine on the highest of their many gear ratios until the little end appears through the cylinder head, having had more difficulty to knock its way through the carbon deposit than through the cylinder head itself! WINKLE.

Burslem.

HIGH TAXES OR MANY TAXPAYERS—WHICH?

Sir,—The new taxes are due, and when I look around me, here in Sheffield, and see the harm already done by this senseless scheme it makes me wonder where it is all going to end.

We who are interested in the manufacture of steel, for which this city is famous, were hoping that the motor trade would absorb a large amount of our enterprise, and our hopes were realised until this new taxation was mooted.

Not so very long ago our legislators sent men to impress upon us that only by hard and constant industry could we hope to redeem our position, and they then follow it up by this.

In my humble opinion it would be much better to increase the number of motorists by letting the old taxes remain, and reap the benefits in trade and revenue which would automatically follow.

Sheffield. W 7755.

SUGGESTED 4 MM. SPARK GAP FOR TWO-STROKES.

Sir,—Now that the flywheel magneto is a practical proposition on two-strokes, why not take advantage of the increased electrical output to eliminate the four-stroking defects of this type of engine?

Over nine years ago I proved to my own complete satisfaction that four-stroking when running light, and after sudden throttle changes, was mainly a matter of ignition.

The standard magneto and plug, as developed for four-stroke engines, is totally inadequate for the ignition of the attenuated and adulterated charges prevalent, at times, in two-stroke engines.

What is really necessary is a magneto giving a current capable of jumping at least 4 mm. at low speed, also a larger size plug giving a gap of 4 mm. without risk of shorting.

I can assure manufacturers of two-stroke engines that experiments in this direction will give surprising results.

Coventry. W.H.T.

A QUESTION OF COST.

Sir,—Several motor cycle manufacturers have commenced during the past two years to use steel in place of malleable iron frame lugs, and some are now making a great advertising point of this.

The lugs to which these advertisements refer are the steering-head and other vital lugs of the frame. These steel lugs, *bored out from the solid stampings*, are obviously a deal more costly than were the old malleable lugs.

Can the designers, who advertise the advantages of these expensive lugs, say why this additional cost should be imposed upon the long-suffering motor cyclist?

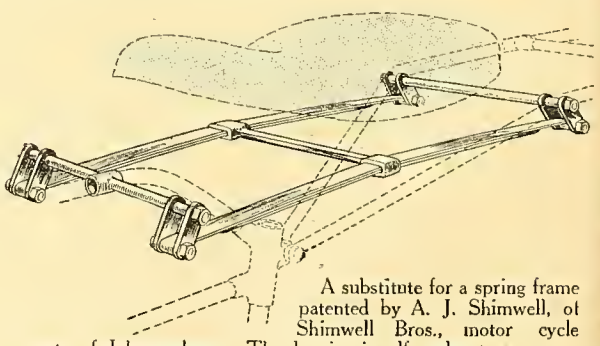
To the ordinary rider with a little knowledge of metals and of frame building, this steel lug business appears to be only one of those expensive fads which many designers have, the accumulation of which goes a long way to increase the cost of the present-day motor cycle.

A little information from the responsible designers would be helpful. ANTI-FAD.

Birmingham.

CAR PRACTICE IN MOTOR CYCLE DESIGN.

Sir,—Surely your correspondent, "Patient Pete," can have had no experience of the Cox-Atmos carburetter?



He states that, on any motor cycle not fitted with a kick-starter and variable gears, "an automatic carburetter is hopelessly out of place, as it will not supply sufficient power from cold to let the rider get away easily."

I beg leave most emphatically to disagree with your correspondent.

My machine is an early 1914 single-geared (no clutch) Rover, and to it I fitted one of the first motor cycle carburetters that Messrs. Cox Carburetters turned out of their works, and it is no exaggeration to say that it literally transformed my machine. I could (and, after a season's mileage of 10,000 odd, still can) paddle away from cold, accelerate to forty-five or more miles per hour in two or three hundred yards, whilst the slow running was a revelation.

The hill-climbing abilities of my old single-speed 'bus have been well proved in more than one trial of the Birmingham M.C.C. Besides winning two silver medals, it won a special mention in *The Motor Cycle* report of the Llangollen trial.

As for economy on long runs, I have obtained 140 m.p.g. on benzole. E. H. SEYMOUR TYE.

A substitute for a spring frame patented by A. J. Shimwell, of Shimwell Bros., motor cycle agents, of Johannesburg. The drawing is self-explanatory.

FURTHER OPINIONS WANTED

Sir,—Might I make a suggestion on a subject that concerns most all weather motor cyclists, namely, cleanliness. Even on the best machines in dirty weather one is liable to collect a certain amount of mud. Prevention is, of course, better than cure, but prevention being apparently impracticable, I suggest that the A.C.U. or any other large club, should fit up a house as a "changing room" and garage, for the convenience of provincial motor cyclists, within easy reach of a tube station on the outskirts of London, at, say, Hammersmith, where for a small fee one could garage the cycle and change into more orthodox attire before proceeding "up town," or to an hotel.

In time this scheme might be extended, the local club at each large town might be responsible for the "changing house."

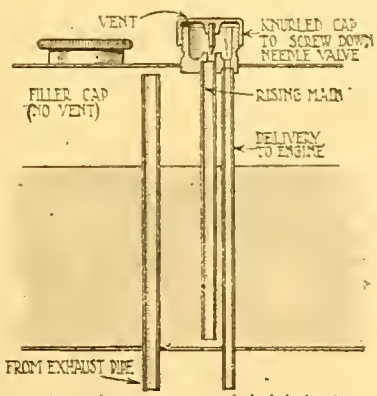
Personally I should welcome such a convenience at half-a-crown a time. D. G. MACASHIL.

AUTOMATIC LUBRICATION.

Sir,—With reference to "Ixion's" plea for automatic lubrication in a recent issue, we describe below our patented system. The attached sketch should elucidate its general principles.

A small pipe from the engine exhaust supplies pressure to the top of the tank and forces the oil up the rising main past the needle valve to the small chamber surrounding the valve, whence it flows by gravity to the engine.

The following points are to be noted:



1. Automatic Control of Supply.

The manner in which this system controls the supply as compared with existing systems is illustrated in the table given. From this it will be apparent that a pump or other mechanical device, unless its supply is further controlled in conjunction with the throttle, must, assuming it is designed always to deliver sufficient oil, be at times delivering too much. Other existing systems must inevitably be wrong—their only safe method of operation is to supply always too much oil, causing unnecessary carbon and unnecessary expense. The Peters system, with the needle valve once correctly adjusted, will supply always, at all speeds and powers, the correct minimum oil supply adequately to lubricate the engine—and no more.

VARIATION OF OIL SUPPLY WITH THROTTLE OPENING AND ENGINE SPEED.

	Hand Pump or Gravity Drip Feed.	Mechanical Pump.	Peters System.
Low throttle Low revs.	Either constant or erratically varied by the rider	Small supply	Small supply
Full throttle Low revs. (*i.e.*, labouring)		Identical with above	More than above
Full throttle Full revs.		Large supply	Large supply
Low throttle Full revs. (*i.e.*, downhill)		Identical with above	Less than above

2. No Variation with amount of Oil in Tank.—In a plain drip feed lubrication system, the head forcing the oil past the needle valve may vary as much as 100% between full tank and empty tank. In the Peters system, the oil is forced past the needle by a pressure equal to several feet head of oil—hence the few inches variation of level in the tank has no material effect on the supply.

An exhaust pressure-fed lubrication system referred to in the letter of Mr. D. Esdale.

3. Automatic Starting and Stopping.—It will be noted that the chamber round the needle valve is vented to the atmosphere. When the engine is stopped, the pressure in the tank blows off through the exhaust pipe, and the oil in the rising main drops back to the mean level. The oil contained in the delivery pipe runs into the engine, providing a little free oil for starting up. The vent prevents any possibility of a syphon action keeping up the flow of oil. On restarting the engine the system begins to operate at once.

You will thus see that the system is fully automatic, with not even a tap to turn off when starting and stopping, and the oil supply is controlled perfectly to suit the requirements. DONCASTER ENGINEERING CO.
D. ESDALE.

SUMMARY OF CORRESPONDENCE.

Encouraged no doubt by recent letters, several correspondents have sent us (more or less) authenticated accounts of extraordinary speed work. In one case this interesting subject provoked the Muses, as follows:

"'Tis indeed a troublous question—the true answer I can't place—
Does racing make men liars? or do only liars race?"
(H. G. Chapman.)

We have received a letter over the signature "Official M.C.C.," in reference to an article on a competitor's experiences in the London-Exeter by "H.E.S." "Official M.C.C." takes our contributor to task for his reference to an "inevitable blind"; and he further states that he is not surprised that a workman, near Sidmouth, made some disparaging remarks in regard to noise. He alleges that this competitor rode an extremely noisy machine, and even had he finished the Trial he would probably have been disqualified on this account.

Under the pen-name of "Gadget," a correspondent revives the old suggestion that pedal cyclists, too, might contribute to the revenue, and thus partially relieve the big burden of the motor cyclist. Several readers, however, write in an entirely different strain, and suggest that, if one can afford a £100-£200 sidecar outfit, one should be prepared to pay the comparatively small sum of £4 in taxation. It is somewhat late in the day now to criticise the new taxation rates with a view to modifying them, and for this reason we are compelled to hold over several letters on this subject.

Many correspondents have written to point out various advantages they have gained from membership of the A.A. and A.C.U., and "F.G.H.H." considers the previous subscription (10s. 6d.) to the former Association to have been absurdly low. He does not think that the A.A. should be perturbed because "An Ungrateful Member of the A.A." and several other correspondents have announced their intentions of resigning from that body.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"MOTOR CYCLE REMINISCENCES." By "Ixion," of *The Motor Cycle.* An interesting and amusing description of early motor cycling experiences, with many unique illustrations ...	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20 Tudor Street, London, E.C., or of leading Booksellers and Railway Bookstalls.

QUESTIONS AND REPLIES

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

VARIABLE JET ADAPTERS.

Will you kindly tell me the advantages of fitting a variable jet adapter to my Amac carburetter on a 2¼ h.p. Radco motor cycle? I wish to improve the mileage per gallon, which is rather low. Can the adapter be fitted by a novice without any alteration to the carburetter?—R.S.

The jet adapter will permit you to adjust the size of the jet while the engine is running; also, it allows a small jet for economical running on the level and a large jet for obtaining full power on hills. It can be quite easily fitted to the Amac carburetter, provided that no projecting parts of the engine interfere with the clearance below the jet plug at the base of the throttle chamber.

WHICH WHEEL LIFTS?

Will you kindly let me know on which bend—a right-hand or left-hand—a sidecar with passenger is liable to lift when going at a fair speed? My friend persists that it is a right-hand, and I wish to convince him that it is not. We have decided to accept your statement as final.—D.E.S.

The question you raise has been answered innumerable times in these columns, and it can be tested practically by anyone who has a motor cycle and sidecar. When turning to the left the sidecar tends to lift. At extremely high speeds it is possible, of course, to lift the motor cycle when taking a right-hand bend, but this does not happen usually until 40 m.p.h. is exceeded.

STOPPING ON THE RELEASE VALVE.

When stopping on a two-stroke by closing the throttle and lifting the compression release, the machine stops sooner than if the throttle is closed and compression release not used. Why is this, since in the latter case the cylinder and crank case compression would both tend to stop the machine sooner, and in the former only the crank case compression would be acting? The engine is revolving and the clutch is not used.—W.M.P.

When you close the throttle there is a partial vacuum on the crank case, and, consequently, very little work is expended in inducing and compressing gas. If you open the compression release while the throttle also remains open, a good deal of work is done in inducing and ejecting gas through the release valve, and it is the gas friction at the latter point which chiefly accounts for the difference in effect which you notice.

REMOVING RUST

I should be obliged if you could let me know if there is anything on the market which is really capable of taking rust off the nickel parts of a motor cycle.—L.W.

We know of no preparation which will remove rust from nickel parts. All you can do is to clean it off with fine emery cloth; of course, a slight amount may yield to applications of paraffin or metal polish.

LUBRICATING THE GEAR BOX.

I have been much troubled with oil splashing out along the shaft and on to the belt and clutch plates, causing slip, on my Sturmey-Archer gear box fitted to 1920 Triumph. I have taken the box down and cleared out the lubricant and now suggest repacking with Ambroleum. (1.) Will this, in your opinion, be suitable? (2.) If this grease is too thick, is there any way in which I could thin it down? (3.) If altogether unsuitable, what would, in your opinion, be the thickest grease I could use with safety?—D.K.F.

The trouble you describe is uncommon, and it is quite likely that it is due to the gear box being over lubricated. (1, 2, and 3.) The grease you mention should be quite satisfactory, although thick engine oil is the usual lubricant.

At Maude's Motor Mart. Dealing with some of the mail orders from those who were attracted by the firm's offer of a new 4 h.p. Verus-Blackburne for the customer whose order was opened first. Seated at the table is Mr. W. Pratt, well known before the war as a keen competition rider, and at his elbow, Mr. Geo. Pettyt, the manager.

USING PARAFFIN.

(1.) I should be glad of your advice generally re using paraffin for a 4 h.p. Triumph. (2.) One "expert" in a garage says that a special paraffin carburetter is required; another that he has used his ordinary carburetter without special adjustment. Would it be necessary to heat the carburetter? (3.) Has paraffin a deleterious effect?—N.F.A.

(1.) Paraffin can be used, but it is not to be recommended, as the running is usually very harsh and the engine prone to knock. (2.) A special carburetter is not necessary, but one has to start up on petrol or benzole. (3.) It has no serious effect on the engine if the piston rings are in good order, but it is advisable to drain the oil from the crank case and renew it regularly every 500 miles.

ADJUSTMENTS FOR BENZOLE.

My machine is a 3½ h.p. three-speed Rover (1919) with a B. and B. carburetter. (1.) As I wish to run on benzole, do you recommend me to use a variable jet adapter instead of using a different sized jet? (2.) The gear seems very low for solo work, as it will take me up almost all the hills round Lincoln on top. If I fitted a smaller belt pulley on the rear wheel, would it damage or put a strain on the machine? I want more speed on the level. (3.) If I removed the silencer and merely had a long exhaust, how would it affect the speed? I do not think the noise would be very objectionable if I did this.—J.S.

(1.) If your B. and B. carburetter is one fitted with a variable jet operated by a taper needle on the throttle a variable jet adapter cannot be fitted. There is really no need to alter the jet when using benzole, but it is advisable to lower the level slightly. (2.) It would be easier to fit a larger sprocket on the engine-shaft, and probably the makers of the machine will be able to supply one. (3.) Not to any appreciable extent.

DISMANTLING A CRANK CASE.

? I should be obliged if you would kindly inform me how to separate a 1911 3½ h.p. Humber crank case. —W.H.H.

If you have removed the pulley from the engine-shaft and also the pinion from the shaft on the timing gear side and all the crank case bolts, you should have no difficulty in separating the two halves of the case itself. It is merely held together by the ball bearings, which are a light push fit on the main shaft. Hold the crank case and flywheel assembly horizontally with the driving-shaft upwards, taking the whole of the weight on the top half of the crank case. A few taps with a mallet on the end of the shaft should cause the crank case to come away. A bundle of old sacking should be placed underneath, so that no damage will be done when the flywheels and the timing side of the case drop away.

STOPS WHEN HOT.

? I have a 2¾ h.p. two-stroke machine, which runs perfectly well for about twenty miles, and then the engine gets hot, when the machine will slowly pull up. Afterwards it will run for a few miles and stop again. The timing is correct. (1.) What makes it pull up when hot, and what causes white vapour to come from the exhaust? (2.) Is a 28 jet too large? (3.) What causes a loud whistling from the engine only when hot? (4.) Is T.T. Mobiloil a suitable oil for a two-stroke?—A.J.C.

(1.) The overheating of which you complain might be due to under lubrication, an unsuitable sparking plug, or excessively rich mixture. Blue smoke from exhaust indicates over-oiling. (2.) A 28 jet is rather large; probably 26 would be better, and the petrol level should be $\frac{1}{16}$in. below the top of the jet. (3.) The noise might possibly be due to a partially seized bearing, but we cannot speak definitely as to this without seeing the machine. (4.) The oil mentioned is suitable for your engine.

INCORRECT TIMING OF TWIN.

? I have recently purchased a second-hand 2¾ h.p. Royal Enfield twin (1913, I believe), and cannot get it to fire properly. I have had both cylinders off, and everything appears to me to be in perfect order. The trouble seems to be that one cylinder sucks through the carburetter and blows out through the exhaust, while the other blows out through the carburetter and sucks in through the exhaust. I fancy this is caused through the fact that the pistons follow one another round very closely. By this, I mean that when one piston is on top dead centre the other one is nearly so, though, as far as I can see, they are connected to the crank quite all right. —A.H.S.

You could have no variation in the movements which the pistons make in relation to each other, since both are connected to the one crank pin. It would appear that the valves in your engine are timed incorrectly. The exhaust valves should just close when the piston reaches the top of the exhaust stroke, and the inlet valves at this point should just be commencing to open.

READERS' REPLIES.

BELT WEAR.

As a rider of a 5 h.p. Zenith I should like to inform your Brighton reader, who complains of excessive belt wear, that I had the same trouble until I fitted a John Bull, which is differently constructed from the majority of belts. I get a splendid mileage from this.—X.B.64.

IS IT A PISTON TAP?

I feel sure that noise complained of by "B.R.B." in the issue for January 6th is not a piston tap. Having suffered agonies myself from that "metallic knock or clanking" with an old Triumph, I adjusted and renewed practically everything except the actual cause of the trouble—which proved to be the pulley side shaft bearing. I have experienced this trouble twice, so am sure of the cause. The first time the noise gradually grew until I thought the whole engine must be wrecked; yet examination showed no fault at all at first. Then I found that the crank case housing of the bearing in question was cracked and allowed a slight movement. I had the aluminium welded and packed the ball race, and the noise disappeared. The welding gave way, so I got a new crank case. Then the noise commenced again! In desperation, for the "umpteenth" time I took down the engine, and found that the previous hammering had worn the ball race, allowing a slight play. I have just fitted a new ball bearing in the new crank case, and now the engine runs like a Triumph should do! The noise has disappeared completely.—CLANK.

In your issue of the 6th inst., "B.R.B." is anxious to know the cause of a knock in his W.D Triumph, and I, therefore, venture to suggest that if "B.R.B." holds a piece of rag or something similar against the two bottom fins round the valve ports, he will find that his knock has disappeared. I hope that this tip may help to solve "B.R.B.'s" troubles. —H. S. NOKES.

A BELT THAT TWISTS.

With reference to "W.M.H.'s" enquiry in your issue of January 6th concerning a twisting belt on a 6 h.p. 1914 outfit, perhaps the following advice may be useful to him. Should his machine be a Zenith, the trouble may be due to one of the small chain sprockets in the gear-operating mechanism being loose and allowing back lash on the push rod moving inside the rear frame stay. This would cause one end of the hub spindle to move less than the other when the gear was changed, thus throwing the wheel out of track. I remember having the same trouble on a 1912 8 h.p. machine, which I traced to this defect.—E.H.R.

SOLID TYRES WANTED.

I should advise your correspondent, "L.J.G." (Queries and Replies), to use Rubberine tyre filling, made by Rubberine, Ltd., 17, Market Road, Caledonian Road, N. I find that this filling is very resilient (more so than a "board-hard" tyre), is, obviously, unpuncturable, and the money he gives for his tubes will pay for it, as no inner tubes are required. Mileage of covers is increased fully 50%, as they can be worn down to the canvas.—H.W.L.

EXTRA AIR INLET.

A correspondent in your issue of the 6th inst. asks some questions under the above heading with regard to m.p.g. on a Rudge Multi fitted with a Senspray carburetter. He obtains only 60-65 m.p.g., which is very poor for this machine. I offer a few suggestions which have helped me on an identical machine to get 100 to 110 m.p.g. on the open road and 80-95 m.p.g. in towns. (1.) Loosen the carburetter on the induction pipe, and rotate it so as to lower the float chamber slightly in order to lower the level of petrol in the jet. (2.) A 36 jet should be tried instead of the 38 fitted as standard. The all-out speed will decrease probably, but one cannot have extremes of m.p.h. and m.p.g. at the same setting. (3.) The "dope" tap in the inlet dome should be used when possible. If the carburetter has the latest variable adjustment, put this over to "Petrol—less," and use the instrument as a two-lever carburetter. (4.) Do not always blame the carburetter; faulty valve timing may, and very often does, account for low m.p.g. The engine should be timed as follows (retiming a Rudge is delightfully simple): inlet valve opens at about $\frac{1}{32}$in. (measured on flywheel) after T.D.C. if the machine is 1919 or earlier, and at T.D.C. exactly if a 1920 machine. Give the spark as much advance as it will take for normal running, and retard when starting. (5.) Gold size the joints in the inlet system. (6.) Read "Rudge Wrinkles" carefully: the makers will send it on request.—L. W. E. HARTLEY.

Important Dates.

Jan. 20th—
F.I.C.M. Conference, Brussels.

Jan. 28th to Feb. 5th—
Scottish Motor Exhibition, Kelvin Hall Glasgow.

March 25th—
Richmond Meet.

March 26th—
M.C.C. London-Land's End Trial.

April 27th—
A.C.U. One-day Winter Trial for Stock Machines.

May 14th—
M.C.C. London-Edinburgh Run.

May 25th—
A.C.U. Silencer Trial—Brooklands.

July 22nd—
Grand Prix Race—Le Mans.

EXPERIENCES WANTED.

"S.E.J.L." (Redhill).—General running of Beardmore-Precision with sidecar, and 4½ h.p. Quadrant sidecar outfit.

"R.B." (Torrington).—Tamplin and Gibbons cycle cars: steadiness on road, life of belts, wear of chassis, speed on hills, and springing.

RECOMMENDED ROUTE.

LONDON TO CATTERICK.—J.B.

London, Barnet, Hatfield, Welwyn, Stevenage, Baldock, Biggleswade, Eaton Socon, Buckden, Alconbury, Norman Cross, Stilton, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Leeming Lane, Catterick. Approximately 223 miles.

The British Magneto Industry Menaced.

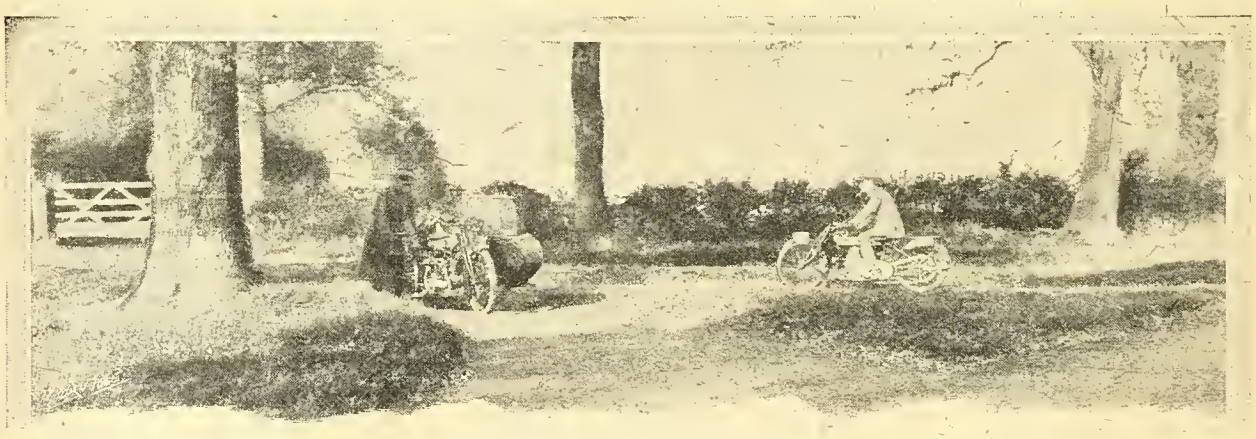
An Unsatisfactory State of Affairs Due to Government Apathy.

DUE to Government delay in redeeming promises made during the war, the British magneto industry is in danger of extinction. Prior to the war, the various branches of the motor industry were entirely dependent upon Germany for magneto supplies. Only the crisis which occurred in 1914 brought this state of affairs home to the Government, though warnings had repeatedly been thrown out, notably in *The Motor Cycle* and *The Autocar*. Quite a furore of excitement was created in German houses on this side when in 1913 the true state of affairs was boldly exposed in the two journals named.

Danger Ahead.

What happened subsequently is common knowledge. Hastily electrical experts got to work, but not for a long time was Government support forthcoming. Indeed, mild rebukes were offered, such as "No firm in this country could make magnetos." Were it not for the fact that stocks of German magnetos were held in this country and America, the position might have been impossible. As it was, a crisis was narrowly averted by the co-operation and wholeheartedness which characterised British enterprise in the electrical field. A small band got to work—thanks largely to Admiralty encouragement—and not many months after the outbreak of war, steady and increasing supplies of magnetos for all types of vehicles and aircraft were forthcoming. From small beginnings the British industry developed its output until the whole of the huge requirements of the British forces were able to be met.

During the war the British magneto industry was acknowledged as an essential key industry, and protection was to be afforded, when peace arrived, to prevent any possibility of a resumption of the old unsatisfactory conditions. Yet, incredible though it may seem, the promised measure of protection is not yet forthcoming, and an industry represented by fourteen firms of manufacturers is in danger of collapse. Last week, at the annual dinner of the British Ignition Apparatus Association, these unpalatable facts were openly talked of, revealing a state of affairs which is to be deplored.



Evidence was provided by the chairman, Mr. Peter F. Bennett, C.B.E., that German magnetos were now arriving in this country in fairly large quantities, and at no fixed prices, the intention being apparently to undercut the British article, and so undermine the British industry which assisted so materially in winning the war. The only hope of preserving national security, he contended, was the introduction of the long promised Bill to protect key industries. British magnetos had proved their worth during and since the war, a long list of notable achievements being instanced, such as the flight across the Atlantic, to the Cape and Australia, the motor cycle T.T. Races, and innumerable successes on road and track. Prices, too, were but 75% above pre-war standard.

Mr. Edward Manville, M.P., opened the eyes of those present when he stated that, in the early months of the war, Britain so badly needed magnetos and Germany was so short of tyres that surreptitious bargaining went on, a set of solid tyres being exchanged for a magneto. Mr. Clem Edwards, M.P., later characterised such action as scandalous, and argued that there should be no risk of that again. Our national safety demanded that such a condition of things in the future could never be tolerated. The magneto industry, he contended, was an essential key industry.

The Need for Immediate Action.

Parliament reassembles next month, when this all-important question of the protection of key industries will come up for discussion. Surely no serious-thinking man can allow the magneto industry to drift slowly back into the hands of the Germans. The British industry proved itself a national asset during the war—an essential key industry, in fact, and the much needed protection then promised is already much overdue, and, to say the least, this is disturbing.

Although the precise terms of the Government's Bill dealing with the protection of key industries is not known, according to *The Times* there is some possibility that it will include magnetos. "Some possibility," however, is altogether too vague.

WHEN SCHEDULE SPEED SUFFERS.

If one sets out to cover a certain distance "against the clock," there is often much time lost through overshooting a corner. It is finding the way that saves the time when off well-beaten tracks.

CLUB NEWS.

Proposed Club for Letchworth and North Herts.

It is proposed to form a club for motor cyclists and car owners, with headquarters at Letchworth Garden City, Herts. Will those interested please communicate in the first instance with Mr. C. F. Plowman, 37, Broadwater Avenue, Letchworth. A meeting will be called shortly to appoint officers and discuss 1921 programme.

Bridgwater and District M.C. and L.C.C.

The annual dinner of the above club will take place at the Golden Ball Hotel, on Tuesday, February 15th, at 7 p.m. Prizes and medals won last year will be presented, and a programme for 1921 discussed. It is hoped that all members will make a special effort to attend. Tickets may be obtained from the hon. secretary, Mr. J. W. Hooper, Wembdon.

Eskdale M. and M.C.C.

This club has had a most successful year. The membership having increased considerably. At the annual general meeting held in the Crown Hotel, Langholm, on December 29th, the office bearers for the coming year were duly elected. It was proposed that if the membership be large enough, steps should be taken to have the local roads improved. It was decided that a club room be opened in the new headquarters at the Eskdale Hotel. This has now been done, and members may have full use of the club room from 9 a.m. till 10.30 p.m. daily. The hon. sec., Mr. James Bell, Eskdale Border Garage, will be pleased to hear from those interested.

Worcester M.C.C.

Mr. W. T. Thorne gave the second of his series of lectures at the Pack Horse Hotel on Monday, the 10th inst., before an appreciative audience of nearly fifty members and non-members. So thoroughly did he deal with his subject, "Ignition," that he was unable to complete the lecture, and he will therefore speak again on the 24th inst.

Rugeley and District A.C.

Despite its title of an automobile club, we understand this newly formed organisation will just as completely cater for the motor cyclist as any of the purely motor cycling clubs. Major J. Selby Gardiner, of Cedar Lodge, Brereton, Rugeley, is president, and the hon. sec. is Mr. H. E. Beasley, 43, Brereton Road, Rugeley.

The Northern M.C.

Nearly 300 guests (with very few exceptions all in fancy dress) made carnival in the best Continental style at the First Annual Bal Masque and Carnival. Thousands of streamers, balloons, and rose petals, and dancing 'neath the kaleidoscopic rays of the limelight, coupled with excellent music, all contributed to the success of one of the most delightful and brilliant dances held in the district for some time. The first annual dinner of the club will be held at the "Turk's Head," Newcastle, on the 20th inst. Prizes and medals awarded during 1920 will be presented. The annual general meeting will take place on the 28th inst. at the "Crow's Nest."

Glasgow Western M.C.C.

The annual dinner of the above club takes place on February 3rd. Further details will be announced later.

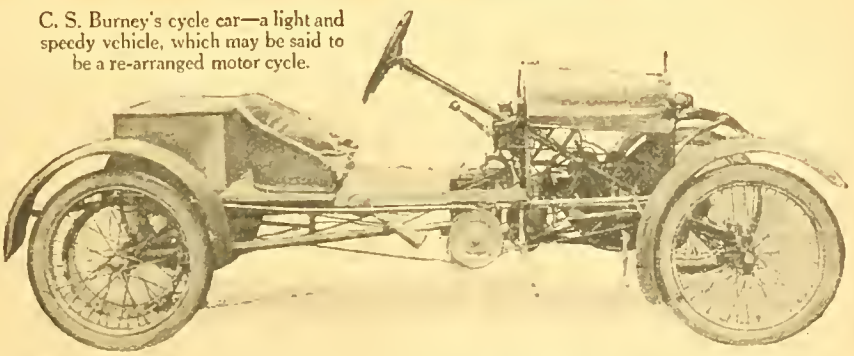
Coventry and Warwickshire M.C.

It is proposed that the opening run for 1921 shall be on Saturday, February 5th, when the members will hold a "parade of licences." An effort is being made to have an inspection by the local authorities, and afterwards there will be a short speed judging competition and tea at a popular rendezvous.

Gorseinon and District M.C.C.

Instead of the usual dinner, a whist drive and entertainment formed the evening's programme at the club's first annual prize distribution on January 6th. Mr. J. M. Bailey took the chair in the absence of the president, and Mr. Cransh, hon. secretary, Neath Motor Cycle Club, made a very able speech. Intending members should note that meetings take place every Tuesday evening.

Essex M.C.

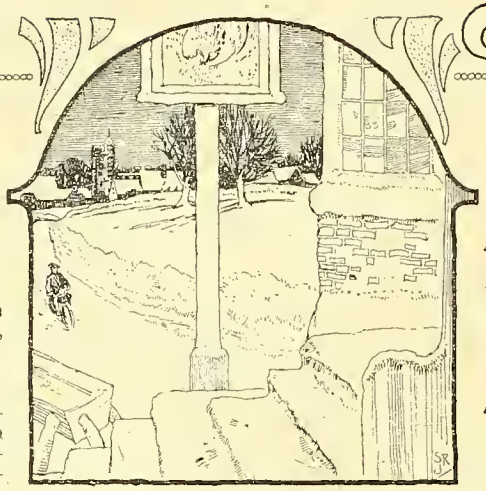


For the purpose of arousing interest among the unattached motorists of Essex and the eastern suburbs of London, the Essex M.C. is holding a cinema and lantern slide exhibition of topical motoring films and slides at the Castle Hotel, Woodford, Essex, on Monday, January 24th, at 7.30 p.m. Admission is free, and the captain of the club, Mr. D. S. Parsons, 119, Kingston Road, Ilford, Essex, will be pleased to forward tickets and particulars to any interested.

A Home-made Cycle Car.

A Blackburne Engined Four-wheeler, with Three Speeds and Reverse.

FROM time to time we receive particulars of ingenious home-made cycle cars built by the originators for their own use. Particular interest attaches to the one described herewith, not only on account of the unusual features which it embodies, but also because it has been constructed by Mr. C. S. Burney, whose name is well known to most motor cyclists. It is engined with an 8 h.p. air-cooled Blackburne, which drives a Juckes three-speed and reverse gear box through a short chain, a second short chain driving a countershaft carried in Hoffmann roller bearings. Two long belts convey the drive to the rear wheels. The chain centres are short, and in each case adjustable.



C. S. Burney's cycle car—a light and speedy vehicle, which may be said to be a re-arranged motor cycle.

Frame Construction and Springing.

The framework is tubular, Chater-Lea lugs being used throughout, and both axles are trussed by means of a king-post and tie-rod. A similar method of staying the longitudinal frame members is employed, but in this case the ends of the tie-rods are anchored to brackets placed below the pivoted centre of the full cantilever springs; thus a shock delivered to the front or rear wheel on either side increases the tension on the tie-rod on that side, and relieves the frame tube to some extent. 28×3in. Palmer Cord tyres are fitted throughout, and the steering is effected by duplicated wires passing over a "bobbin" on the steering column. (This column, by the way, is mounted on ball bearings.) One other unusual feature is the fact that all three brakes—a band brake on the countershaft and a shoe brake operating in each belt rim—are operated at the same time, either by pedal or hand lever. The rod which actuates the band brake is extended rearwards to a crossbar carried on the radius rods to which the belt rim brakes are attached. The adjustments are simple, and in practice the brakes are most effective. After about forty miles road experience with this little machine, which in its present form is fitted only with aeroplane seats, we came to the conclusion that it was an excellent climber, sufficiently fast for all purposes, and fairly well sprung. An accumulator lighting set is used, oil is fed through a Best and Lloyd sight-feed drip, and a four-gallon petrol tank is mounted inside the bonnet. The main features, including the stout tubular mudguard stays, are clearly visible in the above illustration of the outfit.

CURRENT CHAT

Times to Light Lamps

Jan. 20th	... ...	4.56 p.m.

,, 24th	... ...	5.2 ,,
,, 26th	... ...	5.6 ,,

Mexican Oil.

It is reported that petroleum has been discovered in the State of Oajaca, Mexico, on a concession held by a British firm.

Horses and the Roads.

A Committee of the Ministry of Transport has been investigating the problem of horses on slippery roads, but apparently horse owners have insufficient interest in the experiments suggested.

Hard Luck.

E. A. Burney, a well known motor cyclist, who is responsible for the design of the Powell motor cycle, has had a nasty spill during a night ride. He was unlucky enough to break his leg about four inches above the knee. He writes that he is doing as well as can be expected, but it will be some time before he is about again.

An Air Force Reunion.

So many late members of the R.A.F. are motor cyclists that we make no apologies for publishing in these columns the announcement of a reunion dinner for officers of the Aeroplane Experimental Establishment, Martlesham Heath, to be held in London on Friday, February 25th. Old members of the station are asked to communicate with Capt. P. G. Robinson, Room A 139, Air Ministry, London, W.C.2.

The Paris-Nice Trial, 1921.

We have received a letter from M. Hamon, of the Moto Cycle Club de France, on the subject of this year's Paris-Nice trial, which will start on a date between February 21st and 27th. The same route as last year will be followed to Dijon, but there is an alteration in the next section of this journey, which is through Roanne, St. Etienne, to Lyon. There will be one day's rest at Lyon, which will certainly be welcome if the roads are anything like they were last year, but there is likely to be some improvement owing to the alteration in route. The third stage of the journey will be through Valence, Montelimar, and Avignon, while the final stage will be through Aix, Brignolles and Caen to Nice. It will be noted that Marseilles is avoided. This last stage was in excellent condition last year and a very fascinating run. M. Hamon informs us that the trial is being run by the Moto Club de France under the auspices of the U.M.F., but official confirmation of this fact is not yet to hand. He also tells us that he has already received entries of several well-known makes. Those interested in the competition should write to M. Hamon, Moto Cycle Club de France, 65, Avenue de la Grande Armée, Paris, XVI., France.

Texas Petrol from Shale Oil.

There are said to be over 52,000 million barrels of shale oil in one section of Texas, U.S.A. A refinery could produce from this, 50,000 barrels of petrol per day.

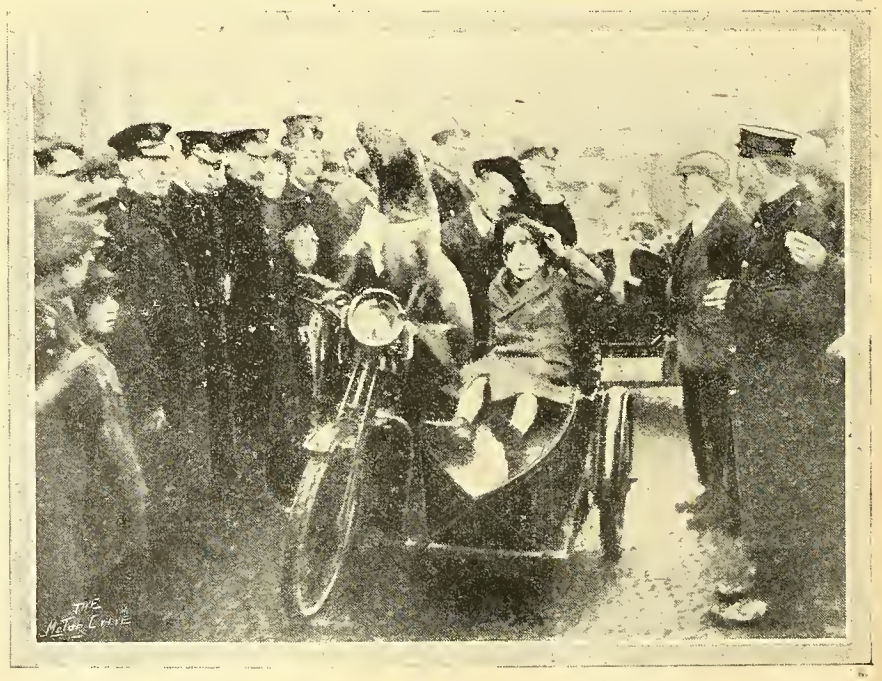
The Paris-Madrid Trial.

Another competition, which promises to be most attractive, is the Paris-Madrid reliability trial, organised by *Moto Revue*, 5, Rue St. Augustine, Paris, from May 2nd to 6th. We are still awaiting official confirmation that this trial has received the official sanction of the Union Moto Cycliste de France, and of the Real Moto Club d'España, and until we receive news of it we will withhold further details. We would call attention to the leading article in the issue of Jan. 13th.

Special Features.

ELECTRIC LIGHTING OUTFITS.
WINTER WEAR.

A Belgian Sporting Trial.



Belgian motor cyclists are to have a trial which has been inspired by the Scott sporting event in this country. This will be organised by the Royal Moto Club Liègeois, and will be known as the "Coupe de la Meuse."

A Belgian T.T.?

Provided the Royal Automobile Club of Belgium run a car race, there will also be a Belgian T.T. for motor cycles this year, which will be run very much on the lines of the Isle of Man event.

Motor Cycles in Belgium.

Notwithstanding the fact that the dollar is worth three times its pre-war value in Belgium, as compared with the pound sterling, which is only twice its pre-war value, American big twins can be bought at a considerably lower figure than the average chain-cum-belt single-cylinder of British manufacture. Mr. J. Taymans, one of the best known Brussels agents, discussed this question with us on the occasion of the recent Brussels Show, where he had a very fine exhibit of both English and American machines, and he regards the position of the British manufacturer as serious. We hope later to refer to many other points raised by Mr. Taymans.

The simplicity of control on a P. and M. sidecar was well illustrated last week in Birmingham, when one of Capt. Woodward's sea lions drove the outfit through the crowded streets to deliver a £300 cheque collected at the Victory Circus for a charity. The machine had a slightly lower gear than usual, and was fitted with a two-lever B. and B. carburetter.

An Omen?

The Western Centre (A.C.U.) has arranged for at least one cinema operator to cover its open trial on April 8th. Does this mean that the route is likely to provide those "stunts" so beloved of the film world? Or is it simply illustrative of the enterprising policy of this newly-formed centre? Probably it is both; but the trial will be a sporting event without a doubt.

Encouraging.

". . . Machines and engines must have been designed and constructed within the British Empire. This rule, however, will not apply in the case of such *secondary equipment as the ignition system*"—an extract from the schedule of conditions for a competition held by the Air Ministry, and quoted by a speaker at the B.I.A.A. dinner as illustrative of Government protection of a key industry.

Benevolent Fund Concert.

The twelfth Bohemian concert of the Cycle and Motor Trades Benevolent Fund in connection with the Birmingham Centre will be held at the Temperance Hall, Temple Street, Birmingham, on Friday, February 4th. Tickets are obtainable from Mr. G. J. Lowenthal, The Leatheries, Sampson Road North, Sparkbrook, and Mr. A. Hickstepp, 10a, Temple Row, Birmingham.

Scottish Ex-D.R.s' Reunion.

The proposed reunion of ex-Signal Service Despatch riders has now been arranged to take place in the Royal Restaurant, West Nile Street, Glasgow, at 7.30, on Friday, February 4th. It was hoped to arrange a dinner, but it was decided that it would be more suitable for the first function to hold a smoking concert, and perhaps to fix a date for a dinner later. Tickets for the smoker are 3s. 6d. each, and may be obtained from Mr. R. Watson, care Jennings, Ltd., 86, Mitchell Street, Glasgow, or from the D.R. Engineering Co., Ltd., Hospital Hill, Dunfermline.

Apply in Time.

Readers are advised not to leave the application for their licences until the last few days of the month, or they may find that they will have to give up riding for a few days, for, although the Ministry of Transport have announced that they do not intend to be hard on those who have been unsuccessful in their efforts to obtain licence holders it is not likely that the same clemency will be extended to those who have not got their licences. In giving this advice we have in mind the case of a rider who applied recently to his County Council for a licence, but did not receive it for more than a week.

Wanted, T.T. Riders.

Many manufacturers have asked us to assist them in finding riders for their machines in the T.T. race, and, as we know many hundreds of our readers are keen to ride in the classic event, we are compiling a register of such riders. This register will contain two lists: (A) Those who have had previous T.T. experience, and (B) registering those who have not ridden in a T.T. race, but have the necessary qualifications. Those riders interested should give brief particulars of successes in hill-climbs and speed events, age, etc., and address their communications to the Editor, *The Motor Cycle*, Coventry, the words "T.T. Register" to appear on the left-hand corner of the envelope.

The Junior T.T.

Apparently there will be several Ivy two-strokes in the Junior T.T., for, in addition to any entries from the manufactures, Blake and Co., of Liverpool, and H. G. Henley and Co., of Great Portland Street, are both entering machines.

Revelations.

So short were we, early in the war, of ignition apparatus that we were compelled to indulge in surreptitious exchanges with our enemies on the basis of one British solid tyre for one German magneto. On another page we give the views of some prominent British magneto manufacturers on this startling state of affairs, and also an expression of their fears that a similar shortage of British magnetos is not a remote possibility of the future.

Motor Cycles and the Scottish Show.

Scottish motor cycle agents do not intend quietly to submit to the present state of affairs in the North, whereby there are no facilities for the exhibition of motor cycles to Scottish motor cyclists. In our issue for January 6th, we outlined a suggested scheme to have a special display of the latest models on show during the motor exhibition at Kelvin Hall (January 28th to February 5th), and arrangements are now well in hand to bring this about. In the meantime a committee of Glasgow agents is endeavouring to formulate a plan to hold a Scottish motor cycle show.

Standardisation.

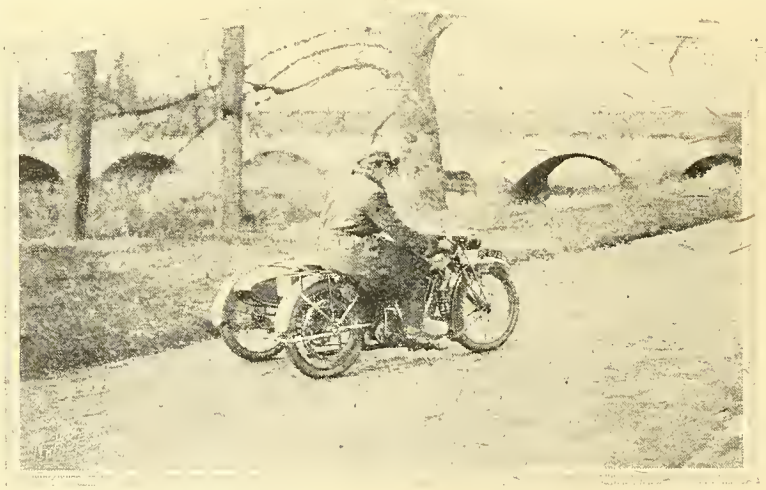
Has anything yet been done to follow up the A.C.U. recommendations regarding standardisation of controls? We think not, and candidly do not expect very rapid action on the part of the trade to bring this about. It can hardly be expected that makers will alter their patterns immediately after settling the details of their 1921 programme. Far better would it be if the bodies concerned would concentrate first on one point—carburetter controls only, which are also probably more important than brakes.

The Six Day Regulations.

Two points in the suggested regulations for this year's A.C.U. Six Days Trials have struck motor cyclists as undesirable. Foremost is the question of attaching sidecars to all motor cycles over 350 c.c., and therefore tending to discourage the solo motor cycle with engines exceeding this capacity. Next comes the considerable body which doubts the infallible accuracy of the Audiometer for the silence tests. It is more than possible that both these features will, after serious consideration of the committee, be removed from the regulations. At the present moment it is not possible to make any definite statement on this subject, but an early announcement is expected.

Coventry's first taxi-sidecar—an Excelsior fitted with an 8 h.p. Blackburne engine. A Burman three-speed gear is fitted and 28×3in. Dunlops. The inset shows the luggage grid dropped down and the spare wheel housing. The sidecar—a Canoelet—is admirably fitted up and is most comfortable.

ROAD TESTS of NEW MODELS

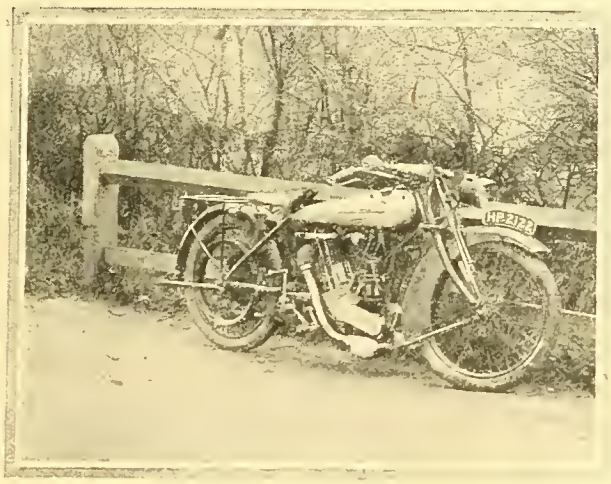


The 8 h.p. Brough Superior.

HOW often has the sporting solo enthusiast asked for a British big twin to compete with the big Americans? Time after time complaints are made that the choice of British big twins is, with perhaps one exception, limited to sidecar machines. There will be many who will argue that 8-h.p. is unnecessary for solo work on British roads, and there is some truth in their arguments, but such persons have probably never enjoyed the perfect motion of a high-geared twin in a small compact machine, which will cruise along at a fast touring speed with the engine just ticking over. The 8 h.p. Brough Superior is a newcomer to the market, which was fully described in *The Motor Cycle* of December 23rd, and during the past week we have had two opportunities of trying out the machine on the road. On the first occasion a light Montgomery sidecar was attached, the gear ratios employed being 3.25 to 1, 5.2 to 1, and 8 to 1. It must be understood that the Brough Superior is designed as a solo mount, but that Mr. George Brough, realising full well that a certain section of the public is sure to fit an attachment, decided to test the machine in this manner. Certainly the racy lines and excellent finish of the sporting model Montgomery suit the machine admirably, and the extra weight appears to make but little difference under ordinary touring conditions. As our first trial was to be a comparatively short one in the neighbourhood of Coventry, we naturally selected a route which would pass over Stoneleigh hill, since this short rise, though nothing to a solo mount, is sufficiently steep to test the pulling powers of the average sidecar machine. In spite, however, of its high top gear, the Brough Superior scarcely noticed the hill, even with a ten-stone passenger in the sidecar. So easy was the climb that we returned to the foot of the gradient, and, restarting at this point, changed up into top and continued the ascent with ease.

Flexibility is one of the strongest points of this new machine, for it will potter along on top at about 10 m.p.h. without snatch or jerk, and is literally as tractable as a lightweight. On the second occasion the Brough Superior was ridden as a solo machine, and at once the merits of the design became obvious. In spite of the big 1,000 c.c. overhead valve engine the machine is small and compact, smaller indeed than the majority of single-cylinder machines. The riding position is a natural one, and the controls appear to come automatically to one's hands.

From the outset one has a feeling of the utmost confidence, and the feeling of hesitation so often experienced in handling a strange machine is absent. The engine starts easily and without fuss, and one glides away with scarcely a whiff of gas. In a few yards top is engaged, and the machine glides along smoothly and easily, responding instantly to a touch of the throttle. Recent recruits to the ranks of motor cyclists who are not accustomed to high gears should beware of the deceptive feeling, for at a speed of 40-45 m.p.h. one gets the impression of



On mounting the Brough Superior, the low and comfortable riding position is immediately appreciated.

Road Tests of New Models.—

about 20 m.p.h. against a strong headwind, and it is well to remind the novice that the high gear of the average machine is approximately the same as the middle gear of the Brough Superior.

In order to obtain smooth running at such small throttle openings, an entire absence of air leaks in the induction system is necessary, and this point has been carefully watched in the design, with the result that the wonderful flexibility is attained. The machine will creep up a gradient of 1 in 9 at a bare twelve miles an hour, yet it will accelerate instantly on the same gradient to a speed which would delight the heart of the greatest enthusiast. Transmission by chain throughout, *via* a Sturmey-Archer gear box and Enfield type shock absorber, is smooth and gentle, and the 700 × 80 mm. tyres ensure comfortable riding, though on the occasion of our trial the tyres were inflated too hard for maximum comfort. Excellent mudguarding is provided, as we were able to prove since the road conditions during part of our test were bad, the final six miles home being ridden in the teeth of a heavy snowstorm. The conclusions which we draw as a result of our experiences are that Mr. George Brough has accomplished exactly what he set out to attain, and has produced one of the most admirable high-powered solo machines that has ever been placed on the market. We should, perhaps, add that the finish and fittings are excellent throughout, and that we have seldom enjoyed a trial run so much in spite of the inclement weather conditions. Our sole criticism lies in the noise of the valve gear at high speed, but it is only fair to state that the machine which we rode has been previously driven hard for well over 2,000 miles, and that the speeds at which the noise becomes unpleasant are well over such speeds as would normally be accomplished on the road.

Ease of manipulation is one of the Brough Superior's best features. Although a powerful mount, there is not a semblance of unwieldiness in handling the machine.

We understand that arrangements are now well in hand for the production of this machine in commercial quantities, and that new works are being erected at Haydn Road, Nottingham, to which place correspondence should be addressed.

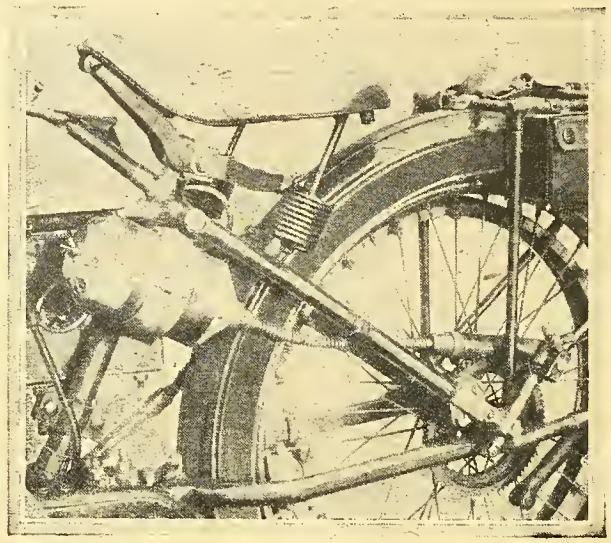
A very commendable feature of this fast and powerful mount is its remarkable flexibility. A flock of sheep was encountered on the road, through which the machine crawled at walking pace.

THE WAITING GAME.

DESPITE the fact that the month of grace is drawing to a close, only a comparatively small number of motor vehicles are displaying the new licences. Quite recently, while visiting one northern city in which about 8,000 registrations had been issued up to the end of 1920, we were told that during the first fortnight of January only 16% of the total number of expected applications for licences had been made.

Does this mean that motorists are hanging out to the last moment, or is it to be assumed that many are allowing their machines to lay by in the hope that the new tax will be repealed? On the face of it the latter hope appears to be a vain one, but it is quite likely that the new necessity of paying over a lump sum in taxation is, at this time of widespread unemployment and financial stress, most inopportune to numbers of motor cyclists.

Rear Wheel Dynamo Drive.



A Speedometer Type of Generator Transmission which may be Instantly Disconnected.

THE usual method of driving a lighting dynamo on a motor cycle has been from some point on the engine, but a variant of this method has recently been patented by Mr. M. Muir, 27, Melrose Gardens, Hammersmith, London, W., who has adopted the principle of speedometer transmission to the driving of an electric generator.

This generator is situated on the saddle tube of the frame of the two-stroke machine to which it has been fitted. (It is a Brolt six-ampère dynamo which charges at half rate during the daytime, thus preventing the accumulator from being over-charged.)

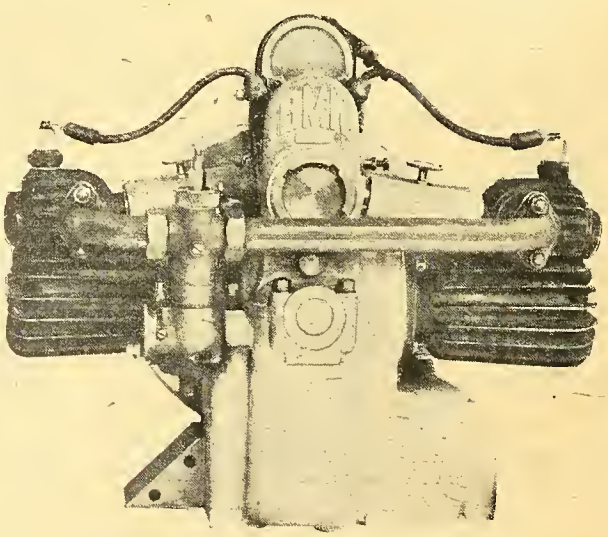
An Enclosed Cable.

The transmission consists of a worm wheel, clamped on to the spokes of the rear wheel, driving a partially enclosed worm connected to the dynamo shaft by means of an enclosed spiral cable. The worm is mounted on a bracket, and is provided with a fly-nut, so that the drive may be disengaged when the accumulators have been fully charged, thus doing away with the necessity of driving the dynamo all the time, whether it is required or not.

Muir's "speedometer" rear wheel drive for lighting dynamos, fitted to a solo lightweight two-stroke.

A.C.U. Test Pending.

The outfit will be sold complete with lamps, switchbox, and cut-out. An accumulator is carried, the box for which can be seen on the other side of the motor cycle frame.



The device is shortly to be put through an A.C.U. officially observed trial to test wear, silence, and adaptability.

Knowing the weaknesses of some present-day speedometer drives, and, consequently, uncertain of the ability of a similar type of transmission to stand up to the much greater resistance of a dynamo, we congratulate the inventor on publicly offering to prove his device by such a test.

Motor Cycle Movement in Germany.

Expected Revival on Account of Prohibitive Costs of Running a Car.

THERE is no equivalent in Germany to the immense motor cycle development of England, nor anything like the healthy revival to be found in France. In all Germany has thirteen motor cycle manufacturers, the great majority of these making nothing but two-wheelers. The only big car-producing firm interested in motor cycles is the Adam Opel Co., at Russelsheim. This firm has produced a lightweight machine since the war, and is offering it at what is considered to be, in Germany, the exceptionally low price of 5,000 marks. This is really cheap in comparison with the price of 20,000 marks for a twin N.S.U. The Opel machine would be considered in England a motor-assisted bicycle. It has a strengthened bicycle frame and a tiny single-cylinder engine driving to the rear wheel by means of a chain.

B.M.W. flat twin, a cleanly designed German power unit, which closely follows English practice.

A Flat Twin.

Reminiscent of a well-known English design, a flat twin engine specially designed for motor cycle or cycle car work has been produced by the Bayerisch Motoren Werke, near Munich. This firm has a very fine factory, erected during the war for the construction of aeroplane engines.

Since the Armistice the works have been converted, and among the new products is the flat twin air-cooled engine shown in the accompanying illustrations. The design is wonderfully neat, and the engine is most up to date in every respect. The two cylinders, which have enclosed side by side valves, are mounted on an aluminium base chamber which forms an oil reservoir. The crankshaft is mounted in ball bearings, the connecting rods are tubular, and aluminium pistons are used. The flywheel is external, and the magneto, a high-tension Bosch, is placed on the top of the crank case. It is claimed that the engine will run under load at 3,400 revolutions, and will turn over at 5,000 revolutions without load. It is the intention of the B.M.W. Co. to produce this engine in quantities for the trade.

Conditions in Germany.

Very few motor cyclists are seen on German streets and roads. Indeed, during a very extensive tour through that country not a single touring motor cyclist was observed, but a certain number of motor-assisted cyclists were met in the leading cities. The reason for this neglect of the motor cycle is the high cost not only of machines, but of fuel, tyres, and repairs.

Until a very short time ago motoring could only be indulged in with a special permit. It is now free, but petrol is very expensive, the legal price being 4 marks 50 per litre, but it is practically impossible to obtain it at this price. The use of a car has gone beyond the means of any but a few *nouveaux riches*, and it is because of this that the motor cycle industry is believed to offer possibilities. It will be several years, however, before even this form of economical motoring becomes really common.

CLUB NEWS. (Continued from page 83.)

A live and sporting club in the North of England, the Ilkley M.C. and L.C.C., which held its annual dinner on Jan. 14th at the Middleton Hotel, Ilkley.

Birmingham M.C.C.

Owing to insufficient accommodation at the Imperial Hotel, it has been found necessary to hold the annual dinner and smoking concert at the Midland Hotel to-morrow night.

Bournemouth and District M.C.C.

It is hoped that as many as possible will attend the general meeting to be held at the Bournemouth Camera Club's room on Wednesday, January 26th. The election of officials for 1921 and consideration of the current year's programme form the chief business.

Ilkley M.C. and L.C.C.

The second post-war annual dinner of the Ilkley Club was held on Friday last at the Middleton Hotel, Ilkley. Upwards of ninety members and friends were present and the evening was carried through with the greatest success. Speech making was cut down to very small limits, a plan which might well be followed universally when no important announcements concerning future policy or programmes are to be made. After the toast of the King, the toast of the Club was called by Mr. D. H. Smith, who, amongst other remarks, commented upon the success of the Ilkley one-day open trial of last June, and of the A.C.U. Six Days Trials, in which the Ilkley Club helped largely, especially as route-finders; the hard work of the president, Capt. J. N. Longfield, and the hon. secretary, Mr. H. W. Sellers, was commented upon. Mr. Sellers, in responding briefly, reviewed the club's doings during the past year. Mr. W. R. Haggas then proposed "The Visitors," calling special attention to the representatives of other Yorkshire clubs who were present, and also to the work of the press. Due response was made by Mr. G. S. Boston, the well-known and consistent winner of speed events and hill-climbs. The final toast of the President was very humorously proposed by Mr. W. F. Scott, and the acclamations which greeted the response of Capt. J. Norman Longfield sufficiently testified to the popularity of the latter. After the distribution of prizes, a musical entertainment was provided, principally by the Dewhirst Brothers, whose rag-time ditties are becoming a recognised feature of Yorkshire club gatherings.

Bedford and District M.C.

A large number of members and friends attended at the Stuart Rooms, on Monday evening, January 10th, when a lecture was given, illustrated by lantern slides, descriptive of the sporting side of motor cycling. The lecturer was Mr. C. F. Plowman, of Letchworth, well-known in the motor cycle world. Few are better qualified than he to bring out the interesting features of the slides. An intensely interesting entertainment was provided. Some very fine slides, from the negatives of Mr. W. Paige Stuart *(Bedfordshire Times)* of some of the club's events were also shown.

Sheffield and Hallamshire M.C.C.

Nearly £450 worth of prizes were presented at the Sheffield and Hallamshire Club's dinner at the Grand Hotel on the 15th inst. Mr. W. Hallam Pearson presided, and the company included Capt. J. N. Longfield (of the Yorkshire Centre A.C.U.) and Mr. H. O. Wood.

During the evening Mr. Dan Bradbury received a presentation as an acknowledgment of great and valued services to the club; and, later, Mrs. Pearson presented the trophies and prizes won during 1920. An excellent musical programme was contributed to by the following artistes: Messrs. W. J. Parker, T. Sheridan, W. J. Laurence Milne, J. Ridders, and Kent Maples.

North-west London M.C.C.

The club introduced in 1914 a very successful meeting, which it is proposed to repeat this year if support is secured. This will take the form of a simple "hot-pot" supper, probably at Golders Green, followed by a visit to the Hippodrome, where a block of seats will be reserved. This affair was, in 1914, thoroughly enjoyable, and it serves the purpose of an informal re-union, and gives an opportunity to new members to see something of their new colleagues. The arrangements will be in the hands of Mr. F. Thomas, 172, Belsize Road, South Hampstead, N.W.

Successful club competitions are largely dependent on a sufficiency of trophies and awards. This display at the Sheffield and Hallamshire M.C.C. annual dinner on Thursday last is sufficient proof of the club's policy.

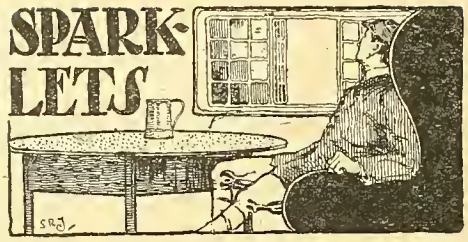
Police Selection of Licence Holders.

Licence holders made by Messrs. S. Smith and Sons (M.A.), Ltd., have been selected by the Metropolitan police for their fleet of cars, lorries, and motor cycles.

Surplus Spare Parts.

Anyone requiring odd spare parts may be able to obtain the very thing they require at quite low prices from the Slough Trading Co., Ltd., Trading Estate, Slough. The company are prepared to fill individual orders as well as to supply in large quantities.

A Record of Successes.



"Achievements" is the title of a copiously illustrated booklet issued by the Harley-Davidson Motor Co., Ltd., of Harleyson House, 74, Newman Street, London, W.1, and it contains a list of successes gained on Harley-Davidson motor cycles and sidecar outfits during the present year.

Taxi-sidecars.

In accepting the B.S.A.-Canoelet taxi-sidecar outfit for licensing by the Birmingham City Police, the makers (Messrs. The County Cycle and Motor Co., 307, Broad Street, Birmingham) tell us that the police experts specially commended the sidecar and rear wheel compensating foot brake. Several of these machines are now on the road, and orders have been secured from Birmingham, Brighton, and Southsea.

Adjustable Footrests.

One often feels sorry for the long-legged rider who has not yet discovered how to modify his pet machine which only has footrest provision for persons of medium height. A simple remedy, however, is to fit new dropped footrests with facilities for adjustment according to length of reach. Various patterns of these are manufactured by the Stone House Works Co., of Spon Lane Mills, Houghton Street, West Bromwich. They are very neatly carried out in aluminium, and are well worth examining.

Wise Policy.

An attractive catalogue giving descriptions of the 2¾ h.p. Wooler machine is now available. The company state their belief that the best workmanship can only be accomplished under the best conditions, hence the charming layout of the model works at Alperton.

A British Success in France.

The premier award in the 1,000 c.c. class of the petrol consumption trials, held in Paris (as described last week), was won by a 6-7 h.p. Ariel and sidecar. With passenger the outfit had to weigh 410 kilos. (902 lb.) so that extra weight had to be carried. Otherwise the machine was quite standard.

A French Opportunity.

Messrs. Greame Fenton and W. F. Nisbet, Moto-Comptoir, 167, Boulevard Pereire, Paris, 17, France, inform us that they are on the look-out for sole agencies for France for all makes of motor cycle accessories. Mr. Fenton is well-known both in England and on the Continent, while his partner, Mr. W. F. Nisbet, is a son of the late Mr. J. R. Nisbet, former chairman of the A.C.U.

Combined Lighting and Ignition.

The new B.T.H. system of combined lighting and ignition, recently described in *The Motor Cycle*, came through its first public test with flying colours. It was fitted on the 2½ h.p. Metro-Tyler ridden in the London-Exeter by J. S. Bennett, who was one of the few riders of lightweights to obtain a gold medal.

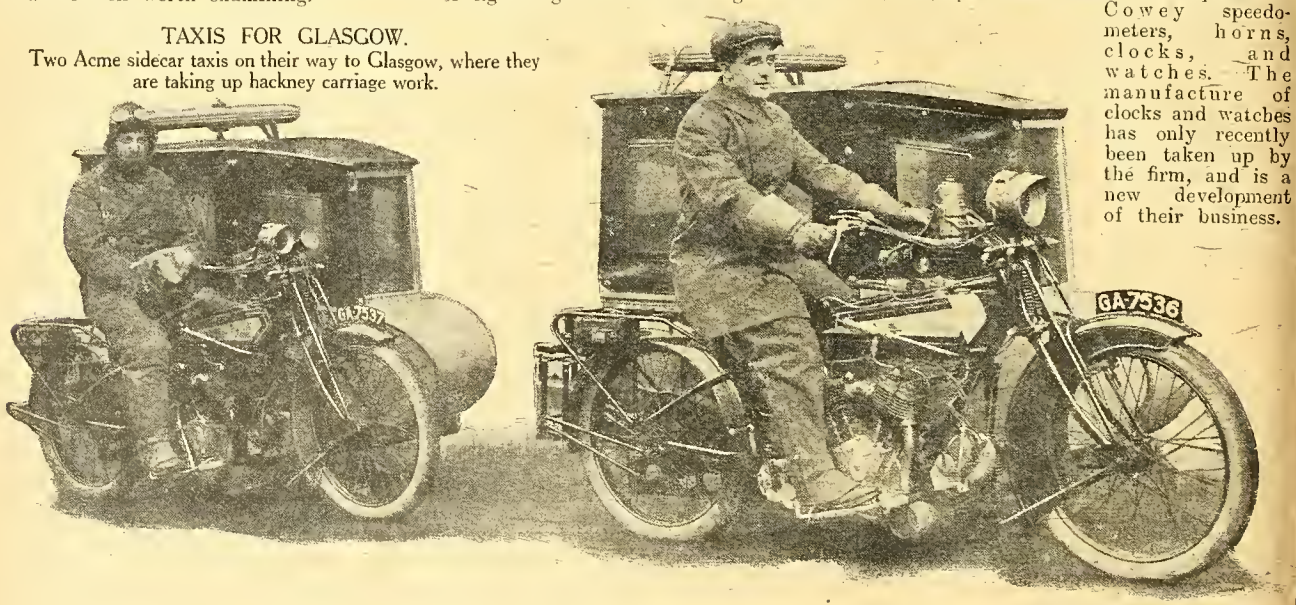
Catalogues Received.

Messrs. Thomas Firth and Sons, Ltd., Sheffield. An interesting booklet on steels, dealing with various methods of testing, notes on case-hardening, and steels recommended for various purposes. The book concludes with some very useful tables.

"Motor Cycling and Lubrication," is a free booklet published by Messrs. C. C. Wakefield and Co., Ltd., Wakefield House, 30-32, Cheapside, London, E.C.2; it deals with Castrol and the many successes and records gained with the help of this popular oil.

We have received a catalogue of Geeko motor cycle electric head, side, and tail lamps, together with a list of the bulbs supplied for these. It is issued by the manufacturers, The General Electric Co., Ltd., 67, Queen Victoria Street, London, E.C.4.

Messrs. T. Bath and Co., Ltd., contractors, 18, Savoy Street, London, W.C.2, have sent us an extensive catalogue of sheds, many of which are suitable for motor cycle houses, and are sold at very reasonable prices. In some cases very big reductions indeed have been made on current market prices.



Messrs. J. Pedley and Sons, Ltd., Oxford Works, Great Charles Street, Birmingham: Motor cycle section, listing the principal Pedley motor cycle tyres, which were greatly appreciated before the war; also tyre accessories, waterproof clothing for motor cyclists, and repair outfits.

Grindlay (Coventry), Ltd., Melbourne Works, Spon End, Coventry. A complete and well-illustrated booklet showing all models of the Grindlay sidecars, including the well-known double sprung models as well as the new rigid-wheel sporting type. A leaflet describing the Grindlay three-panel windscreen, which is adjustable in all directions, is also included.

A new catalogue has been published by the Cowey Engineering Co., Ltd., Archer Works, Kew Gardens, Surrey, giving particulars and revised prices of Cowey speedometers, horns, clocks, and watches. The manufacture of clocks and watches has only recently been taken up by the firm, and is a new development of their business.

TAXIS FOR GLASGOW.

Two Acme sidecar taxis on their way to Glasgow, where they are taking up hackney carriage work.

ACCESSORIES

QUESTIONS ASKED & ANSWERED AT THE SHOW

QUESTION :—

Why is it that the Cox "ATMOS" carburetter gives the sensation of no power, but when carefully checked is found to be giving considerably more, yet the exhaust note is softer?

ANSWER :—

The perfect mixture which the Cox "ATMOS" delivers is so correctly proportioned and blended that perfect combustion results.

The hammer blow due to improperly atomised fuel, and improperly proportioned and blended mixture is lost. You get power by an elastic force, rather than by a hammer-like blow.

The exhaust note is softer because the work of the charge is completed before the exhaust valve opens, instead of after.

This elimination of the hammer-like blow considerably increases the life of engine bearings, transmission, driving wheel, tyre, etc.; it means an economy as important as the fuel economy obtained by the use of the Cox "ATMOS."

Select and test your 1921 Machine AT OUR RISK FOR ONE MONTH

We have so much confidence in our experience, judgment, and the machines we sell that we are making a

SPECIAL JANUARY OFFER

to all motor cyclists, actual and prospective, who can select a new or second-hand machine from our stock of BEST makes, either in person or by post, and have it on test and in daily use for one month from the date of delivery. If the machine is then not entirely to the satisfaction of the purchaser it can be returned to us and exchanged for another make of not less value — NO deduction will be made for the one month's deterioration, we will carry that loss. The value of the machine returned will be credited in full. All Machines sold under this special offer are for cash only — and are dispatched carriage paid. Further, if the machine is not as described, it may be returned at our expense.

START the New Year well — Start it successfully, exercise care and discrimination in your buying, be careful to ensure that you are investing your money in a machine with a good name and reputation — a machine that will sell well at any time you may wish to dispose of it. Do not sink your capital in a second-rate machine that rapidly deteriorates and has no value in the second-hand market. You cannot be too careful, and will be well advised to allow us to help you. We offer you our experience and advice, knowing full well that if you will avail yourself of it, you will invest your money to the best advantage. It is our business and our pleasure to assist you quite independent of sales. We hold no brief for any particular makes of machines, but sell only the BEST, because only the best can give genuine satisfaction to our clients and ourselves. If you cannot make a personal call

WRITE TO US TO-DAY and ask our advice — the pleasure of giving will be ours, the pleasure of receiving will be yours—and if business results, the pleasure of doing business will be mutual.

YOU TAKE NO RISK FROM SUCH AN OFFER

Do not miss it !

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., & Co. and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

EASTERN GARAGE

WHEN FIFTEEN IS EQUAL TO ONE THOUSAND

If your local Baker's business had been commenced in the days of that celebrated (?) baker, King Alfred the Great—over a thousand years ago—it could claim to be one of the first established in that trade.

It follows therefore that the Eastern Garage Company can truthfully say they are equally pioneers of the Motor Cycle Agency business, as fifteen years ago they were one of the first firms to *specialise* in Motor Cycles and devote their business *solely* to Motor Cycles.

Those fifteen years have proved a period of success for the Eastern Garage Company because during the whole of that time they have not departed from their policy of making the customers' requirements their first consideration. As a result the Eastern Garage Company is today one of the premier Motor Cycle Agents of the Country, and have an unrivalled reputation for *honest* trading.

Such a firm can be safely entrusted with *your* enquiry, and will justify your confidence in them.

For the convenience of customers we have prepared separate Stock Lists of—

NEW 1921 MODELS

NEW 1920 MODELS

(at greatly reduced prices)

and

SECOND-HAND MACHINES.

We shall be pleased to send the lists that interest you, and quote deferred payment terms if desired.

ASSIST YOUR ENGINE

save fuel, and increase your mileage. You can very materially do so with a reliable belt. Get the "SERVICE," and a belt of Unquestionable Quality.

THE SERVICE BELT

The belt is made up with two or three layers of chrome leather with tanned hide blocks, top and bottom, rivetted together. The rivets are hollow and accomodate the special service fastener, two of which are given with each belt. The Service belt is very supple, absorbs less engine power than any other form of belting, and has an exceedingly long life. It is easy to fit and simple to adjust. No belt punch is necessary.

OUTLASTS THREE RUBBER BELTS

The two-ply belt is recommended for Rudge-Multi and Zenith standard machines as well as all machines with direct drive from engine to rear wheel.

⅝in.	¾in.	⅞in.	1in.	1¼in.

THIS is the Licence Holder you need—

Don't be rushed into buying Licence Holders produced as a "last moment" effort—you MUST place the holder in the position required by the Government, and it cannot be done unless you have Universal Adjustment. This is where the F.R.S. design stands above all others.

The F.R.S. Holder enables the bracket or clip to be placed at ANY spot—it can swing round to ANY position, and be instantly locked there. ONE NUT regulates the whole thing.

Order NOW—delivery from Stock!

Brass, Nickel Plated, Black and Brass, or Black and Nickel Plated **5/-**

Plus **6d.** for packing and postage.

F.R.S. New Straight Horn

Designed by experts in musical instrument manufacture. Embodies a special reed, immovable dust cap, latest patent ONE NUT handlebar clip, and straight through 'note' of loud and sonorous quality.

Finished in finest smooth black and nickel plate.

STEVENS Special 1921 Bulbous Back Sidecar, the most luxurious streamline turnout on the market; price complete £27.

STEVENS Sidecars can be supplied with fittings to suit any make of motor cycle; bodies and chassis can be had separately if required.

STEVENS Sidecars.—Write for our illustrated catalogue before deciding. Second-hand and clearance sidecars usually in stock.

STEVENS Sidecars, 184-186, Pentonville Rd., King's Cross, London, N.1. Tel.: Central 10264. [6681

LICENCE Holders, circular, suit motor cycles or cars, conforming to Transport Ministry regulations.—Below.

LICENCE Holders, black, 3/6; brass, 4/-; aluminium, 4/-; plated, 4/6; postage 6d. Money returned if not satisfied.—Middleton's, below.

MIDDLETON'S are standardising their patent applied for spring wheel sidecars for coming season; rigid sidecars to order.

MIDDLETON'S Spring Wheel Sidecars are guaranteed for 3 years on usual conditions.

MIDDLETON'S (patent applied) one-piece unbreakable chassis axle, with spring wheel, is fitted to all our 2-seaters and sidecars for heavy, powerful machines.

MIDDLETON'S undertake all classes of repairs to motor cycles and sidecars, bodywork, etc.

MIDDLETON'S, London's oldest established sidecar makers, 27, Stroud Green Rd., Finsbury Park. 'Phone: Hornsey 1584. [4809

BASTONE'S for Sidecars and Bodies; no better or cheaper house. Kindly inspect our models before purchasing elsewhere.

BASTONE'S.—New 1921 sporting and other models in stock. Bodies from £4/10; complete sidecars from £16/10.

BASTONE'S.—We have a few soiled sidecars and bodies to clear at low prices.

BASTONE'S.—Distributing agents for the famous Montgomery sidecars. Latest 1921 sporting and other models in stock; trade supplied.

BASTONE'S (Sidecar Dept.), 228, Pentonville Rd., King's Cross, London, N.1. Tel.: 2481 North. [5533

ROYAL Leicester Sidecars to suit all machines, roomy bodies, comfortable upholstery, excellent springing; prices from £19/10 upwards.

SEND Your Sidecar to us for renovation. New hoods, wind screens, and aprons fitted. Write for catalogue.

THE Willowbrook Co., Royal Leicester Sidecar Works, Belgrave Gate, Leicester. [0335

HENDERSON Sidecar.—Large stock of all models, shop-soiled, at greatly reduced prices; now is the time to buy.—Mebes, 154-156, Gt. Portland St., W.1. 'Phone: 3426 Mayfair. [6754

CANOELET Special Touring Model Sidecars, underslung, bulbous backs, coverall aprons, 28×3in. wheels with heavy Dunlop tyres, new; at half list price; special models for Harley-Davidson.—Holliday Bros.—Below.

DOUGLAS Sidecar Chassis with wheel, no tyres, £2/15 each; £2/10 each in lots of 5.—Holliday Bros., 20 Queen St., Hammersmith, Broadway. [6734

PARAGON (patent) Folding Sidecar saves storage, has seven years to its credit, and has proved itself absolutely reliable. Fits any make of motor cycle, and when folded combination will pass through a 30in. doorway. Call and see it demonstrated.—Wincycle Co., Ltd., 236, High Holborn, W.C.1. [0388

SIDECAR.—Have a Hopley folding sidecar. No need to pay garage. You can keep motor at home; will go through passage 28in. when folded on any motor. Any shape body fitted. They have been well tested for six years on motors up to 8h.p.—Hopley, Upper Highgate St., Birmingham. [0152

RIDEEZI.—Special offer of 100 brand new chassis and bodies, to be cleared at once, various models, fittings accurately machined to suit all makes, fully guaranteed. Write for special list. Cannot repeat.—Sidecar Co., 25, Upper Clapton, E.5. 'Phone: Dalston 3110. Grams: Rideezi, Lowclap, London. [6580

RUNABOUTS AND CYCLE CARS.

A.C. Sociable, hood, screen, Binks, new tyres; £50.—Armitage, Clarendon St., Hyde. [6709

A.C. Sociable, splendid condition; £75; any trial.—Seen Farthings, Photographers, Tooting. [6817

1921 Richardsons, Morgans, Triumphs, Scotts, Rudge, etc.—Ewens, Garage, King's Lynn. 'Phone: 122. [4599

THE MOTOR CYCLE

Insurance Policy

Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. - Original letters may be inspected.

Dear Sirs,

I beg to thank you for yours of the 30th inst., enclosing cheque in settlement of claim.

You certainly live up to your reputation for promptitude, and I have great pleasure in expressing my appreciation of same.

Yours faithfully.

The only Safe Test of Insurance is Claims. We settle Claims promptly.

The AUTOCAR FIRE and ACCIDENT INSURANCE COMPANY, LIMITED,

(Incorporating The Autocar Insurance Department, Established 1904.)

Head Office;

77, Cheapside, London, E.C.2.

Telephone: City 9831 and 9832.

Branches: BIRMINGHAM—Guildhall Buildings, Navigation St. MANCHESTER—199, Deansgate. LEEDS—Calvert's Chambers, 8, Commercial St. NEWCASTLE—Atlas Chambers, Westgate Rd. CARDIFF—15, High St. GLASGOW—137, West Regent St.

RUNABOUTS AND CYCLE CARS.

1921. W.C. De Luxe Morgan, discs, lamps, n £240, makers' list price. — Chaston, Bl wood, Mon. [7

G.N. Cycle Cars; latest models always in stock.— deliveries from Drake and Monat, Ltd., M Agents, Bracknell. — [3

MORGAN Chassis, thoroughly overhauled, new t new discs, J.A.P. engine; £120.—Downing, Union St., Ryde. [6

MORGAN New 1920 de Luxe, W.C., complete hood, screen, lamps, horn, etc.; £225.—Gibb, G cester. 'Phone: 852. [0

1920 Morgan De Luxe, 8h.p., A.C. J.A.P., as engineer owned, fully equipped, tax paid; £2 30, Bourne St., Dudley. [X

G.N., 8h.p. J.A.P., 2 speeds, Binks, lamps, just hauled; £130.—Homac's, 243, Lower Clapton N. 'Phone: Dalston 2408. [7

CARDEN Monocar, torpedo shape, J.A.P. en 2-speed, 6h.p., splendid condition.—Galla Te Whare, Gerrard's Cross. [6

ROVER Light Car, 1921 model, 8h.p., in stock immediate delivery; £300.—Godfrey's, Ltd., Gt. Portland St., London, W.1. [0

A.V. Monocar, £50, genuine bargain, in splendid dition, ready to drive away; tax paid this ye Broadwater Garage, Worthing, Sussex. [6

MORGAN, aero model, 1920 machine, sporty fast, M.A.G. engine, accessories included; £ —Wauchope's, 9, Shoe Lane, London. [7

The State of the Trade.

THERE is undoubtedly at the present moment a tendency on the part of the purchasing public to withhold orders in the hopes of a decline in prices. A slight fall in the cost of some materials is probably the root of these hopes, and it is only natural that the purchaser should be anxious to pay the minimum price for his 1921 mount.

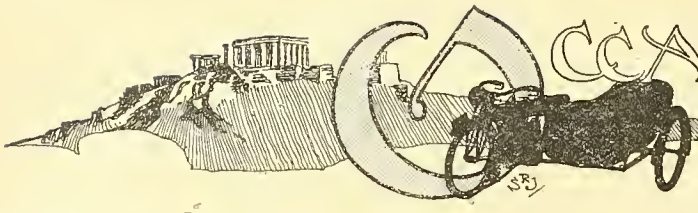
There may be grounds for expecting a drop in the motor cycle prices in the not distant future, and certainly by 1922; but, be this as it may, to withhold an order at the present time is likely to delay that most desirable event. It needs very large resources for manufacturers to build for stock. Furthermore, not many factories have sufficient floor space to carry a heavy stock, and, should works be compelled to slow down, there will inevitably be a shortage of machines when the spring orders arrive.

As a consequence prices will remain high, and much trade may be lost.

The plain fact is that manufacturers ever since the war have been hampered by shortage of materials. When, last summer, the position eased slightly, most makers decided to replenish their stocks, while the opportunity was favourable. This meant that the high figures then prevailing had to be paid, and it is on these costs that the present prices of motor vehicles are based. Thus it will be appreciated that any decided reduction in selling prices would, in the majority of cases, entail definite loss to the manufacturer. Clearly, then, these expensive materials must be absorbed before price reductions of machines become general.

During the past week we have received communications from two well-known concerns, one a prominent manufacturer and the other an equally well-known distributer, dealing with this very question. Both point out the serious damage to the trade which may result from any marked depression at this time of the year, and both are prepared to guarantee to refund the difference between ruling prices and those in force at the end of May. This sporting lead deserves encouragement, and we hope that the firms concerned will receive a due measure of orders. Such promises reassure the buying public and assist in stabilising trade.

International Records.



A LIST of officially recognised world's records has been compiled at last. Hitherto the records made on Brooklands have been regarded merely as British records, and figures set up in America have not been taken into consideration. A section of the public has not accepted too readily some of the speed claims of record-breakers in the United States. The acceptance some time ago of the American organisation as members of the International Federation of Motor Cycle Clubs, and the compilation of the first list of world's records, in which several U.S.A. figures are included, officially places America in her rightful place.

British motor cyclists have always been among the first to give credit where credit is due, and now that the U.S.A. holds the world's records for speed (over 108 m.p.h.) there will probably be keen competition on this side of the Atlantic to beat the figures; whereas while American records and British records were distinctly separate, and the former not recognised in this country, there was little inducement to do so.

The world's records do not include the British one-way records for kilometre and mile. Therefore, many classic records are automatically eliminated. The mean speed method is certainly the better, although not the easier, way of obtaining records, as, then, no advantage can be taken of a favourable wind.

The object of eliminating Class A1 (275 c.c.) will not be clear to British motor cyclists, but it must be remembered that Great Britain is only one of the countries representing the F.I.C.M., and the decision was made by the vote of the majority.

An Index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

BY "IXION"

On the Border Line.

SOME of our thriftier boys are spending an anxious time this month in their efforts to get down to the 30s. tax. One idle scoundrel of my acquaintance thought it would suffice if he excavated the crank case from the mud and oil accumulations of years. Not a bit of it. Then he let the air out of the tyres. Still over 200 lb. Finally he had a brain wave. He took off his Sturmey-Archer hub-wheel, and inserted a plain T.T. wheel. I think he has caught Sir Eric bending here, as the Act says nothing about swopping wheels after you have paid your tax. But if many people do it, the police will begin to sink weighbridges in the roadway at the entrances to all large towns. In which case I shall reluctantly split on quite a number of my correspondents who have got down to 30s. by ways that are child-like and bland.

Splitting Two Gallons.

IT is high time that the A.C.U. or some other body tackled the question of fuel supplies for motor cyclists. On my way to and from the North I was recently refused supplies of fuel unless I took the whole can. Some tanks will easily hold two gallons, but such a capacity does not solve the difficulty, because we dare not ride on until a mere drain remains at the bottom of the tank. The reason of refusals to split a can is quite obvious—many cans do not contain two gallons when opened. The other day I was at the Exchange Motor Depot, Highfield Road, Rock Ferry—a garage which does a large trade with Cheshire riders who wish to put up their machines while they cross to Liverpool—and is, therefore, willing to split cans. A light car owner wanted to fill his tank right up, and was replenishing by measure. A sealed can was opened, and measured; it contained seven and a quarter quarts, but the buyer had to pay for eight quarts. If the buyer had made a fuss, or if the can had been sold in small amounts to two or more purchasers, the garage would have lost the value of a pint and a half. The problem clearly divides itself into two halves, viz:

(1.) As between garage and motor cyclist.
(2.) As between garage and petrol syndicate.

The first half would be met if the A.C.U. supplied a special plaque to those garages which are open to split cans. The second half is a thorny matter. I presume that no canning concern can absolutely safeguard itself against leakage and evaporation. But I should fancy that the agents' association is strong enough to force some sensible agreement upon the petrol companies. Can any reader with trade experience in America tell us whether similar difficulties arise under the "bulk storage" and stand-pipe system of selling petrol? We must not forget that the private owner suffers from short measure when he buys whole cans. I generally buy thirty cans at a time, and many of them contain much less than the alleged two gallons. When petrol was 9d. per gallon we put up with such losses. Now we are less inclined to take these shortages lying down. If the A.A., R.A.C., and A.C.U. tackled this matter seriously, they might do their members a very good turn indeed.

Sinews of War.

ALL sportsmen will feel with Mr. A. L. Judge that each maker should be represented in the T.T. by the same number of machines, just as each country used to be represented in the International Cup Race by three riders. In fact, Mr. Judge might well have gone further, and applied the same principle to the Six Days. I should long ago have tilted at this very obvious windmill if the T.T. were not—unfortunately—an extremely expensive event to organise and run. The A.C.U. give such limited publicity to their balance sheet that few riders know exactly how much they make or lose on their bigger events. But Mr. Judge will doubtless recognise that a standard T.T. entry of one machine per make might result in a heavy loss, and that a standard T.T. entry of three machines per make would tax the resources of the smaller makers to the limit. Still, I fancy that the principle which Mr. Judge pleads for, is slowly coming into its own. For example, if the T.T. recommences to attract entries on the 1913 scale, it may prove feasible to rule that not more than three machines of one make shall be entered. Moreover, if the A.C.U. attempt to carry out their very complex proposals for the 1921 Six Days, they will surely be forced to limit the total entries. And a limited total entry should imply limited individual entries? On several notorious occasions, both in races and reliability events, the sole survivor of a team has earned kudos for a maker who hardly deserved it.

Listen to This.

IT is many long years since I attended Sunday school, but unless a paganised memory deceives me, one of the commandments says, "Thou shalt not covet." Temptation is sometimes irresistible. I quote from a letter just to hand:

"All went well to the other side of Lichfield, when without any warning she stopped and refused to fire at all. You could grasp the h.t. terminals and never feel a shock. So I sat down by the roadside and took the mag. to pieces. All the screws were covered with iron filings, but right inside the thing on the condenser plate was a spot of grease with a nice curly steel shaving cosily embedded in it. The wretched thing had chased round and round, tearing the insulation before it finally shorted all the lot. I removed it and faked it up with candle grease—I always carry a small piece of candle for wiring emergencies—put it

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Occasional Comments.—

together, and went on rejoicing. When I got home I sent the thing to the makers. They sent it back in a few days with no remarks and no charge, but plus a new armature, new magnets, and a new contact-breaker."

Reflections on above:

Happy thought—write scathing comment on careless workers.

Happy thought—always carry a bit of candle.

Unhappy thought—should I know how to use it?

Unhappy thought—I was not consulting radiologist to B.E.F., as the writer of above was.

Final spasm—what exactly *is* a "radiologist?"

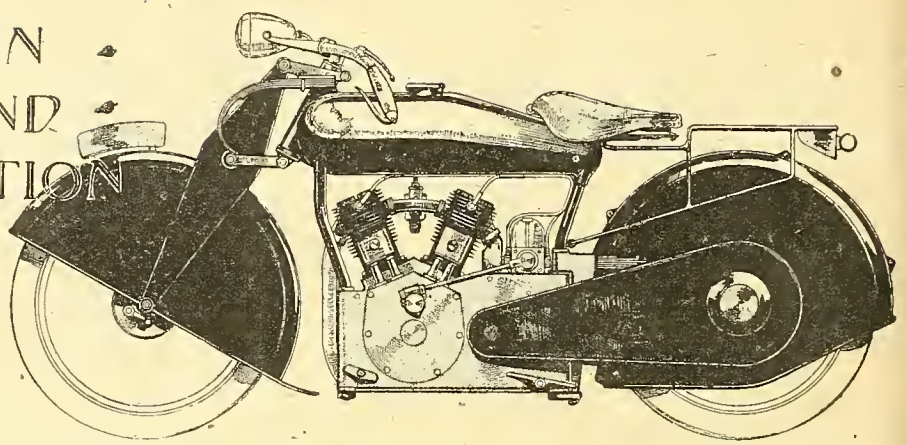
Asking too Much.

A NOVICE correspondent asks me to instruct him per this column in the repair of chains and the adjustment of wheel spokes. He need not worry about his chains. If his service chain is new, he need only carry a few spare links and a rivet punch. Nine times out of ten he will be able to deal with any road emergency by means of the adjusters on the machine, but if an actual fracture occurs, he will be able to restore the damaged chain to the proper length by removing the damaged link or links with the aid of the punch, and inserting spare links or half links to suit with the aid of the spring clips provided. As the chain ages, it becomes a wise precaution to carry a complete spare chain; but this is seldom done except as an insurance in big trials. If a chain is cleansed in paraffin and relubricated at regular intervals, its life should exceed 5,000 miles; and when it is worn out, the sprockets are usually hook-toothed, and new chain wheels are essential.

The truing up of a wheel stands in quite a different category. It is a job for a skilled man, and should not be attempted by an amateur until he has repeatedly watched a skilled mechanic perform the operation; even then he should preferably borrow somebody else's wheel on which to make his first experiment. I am not surprised that my correspondent has wrecked his sidecar wheel by tackling the job on his own.

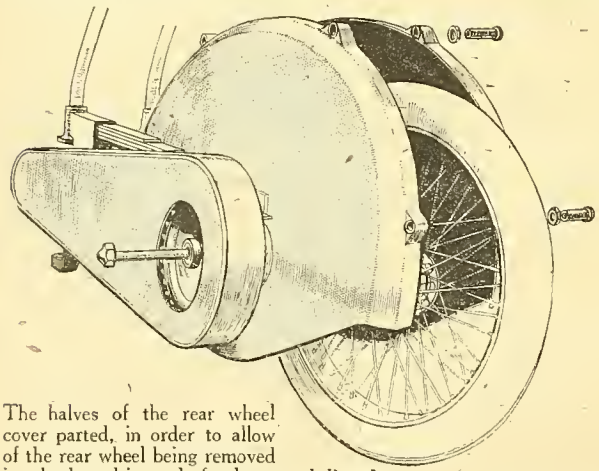
Security Bolts.

NOBODY likes security bolts, but I quite agree with a correspondent that they are possibly desirable on *(a)* high-powered passenger machines, and *(b)* solo 'buses capable of very violent acceleration. Some people say that a good deal of inaccuracy exists in tyre and rim dimensions, but I never find that my low-powered machines suffer from creeping tyres. On the other hand, as soon as I start driving a hog-'bus rather blue, the valve tries to convert itself from a radius into a tangent. If it is any comfort to the sufferers, let me add that sundry imported tyres are worse. Last week a friend of mine brought down an imported car from town. It was fitted with some weird tyre of which I had not so much as heard the name, and the covers simply skipped off the rims if the pressure in the tube were allowed to fall below 80 lb.



My own experiences may not be representative, but all the tyre troubles in which I have participated this year have either been caused by a creeping cover or have been complicated by this unpleasant phenomenon, and a slack fit on the part of the cover can hardly be the cause when it puzzles a hefty man to pull the cover back so that its notches register with the hole in the rim.

A sidecar in the service of an estate steward, who is able to visit, and superintend work, on widely different parts of a large country estate.



NOVELTY IN DESIGN AND CONSTRUCTION

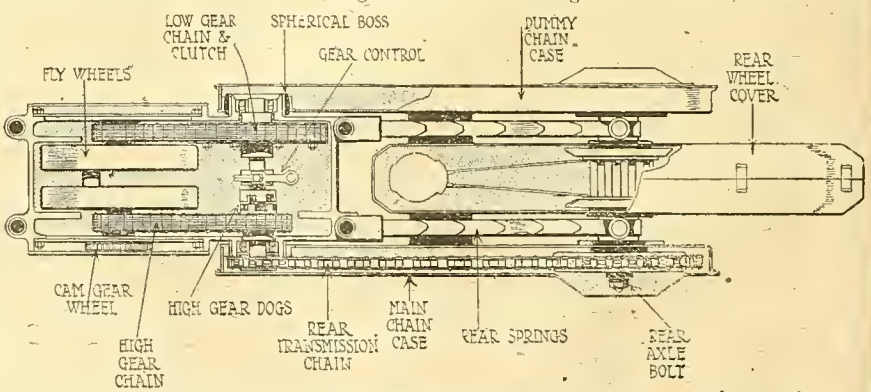
An Outline of a Proposed New Machine which will have Many Interesting Features.

General layout for Capt. Millar's design for a medium-powered machine. Among the points for special notice are the clean lines of the machine, the comprehensive mudguarding of the wheels, the accessibility of the chain case, and the general cleanness of the engine and gear box design.

SINCE the Armistice more change has been seen in the general design of motor cycles than for any two corresponding years before the war, and there has been a readiness to break away from accepted practice on the part of a number of old-established firms in this country. Whether the general design of machines will continue to undergo considerable change more or less *ad lib.* remains to be seen, but it is certain that less reluctance will exist in scrapping deficiencies in design, for the reason that keen competition between the considerably increased number of manufacturers will enforce such action.

The halves of the rear wheel cover parted, in order to allow of the rear wheel being removed in a backward instead of a downward direction.

We have recently been afforded an opportunity to inspect the detail drawings of a machine which shows considerable originality, and in several respects a complete departure from standard practice. In this machine a strong effort has been made by the designer—Capt. I. P. Millar—to overcome some of the outstanding deficiencies of present-day design without complication, and there has been no attempt to introduce the average inventor's favourite innovations, such, for example, as six-cylinder water-cooled engines, shaft drive, armchair seats, wheel steering, and other features often beloved by the inventor.



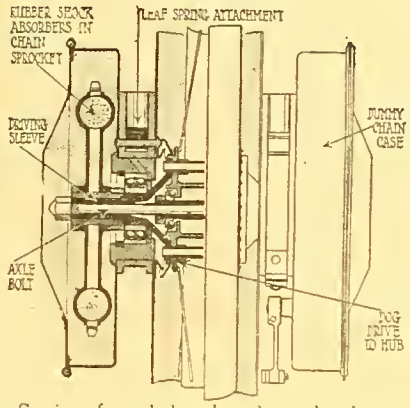
In the design under review there are three features of outstanding interest. The first is the use of stampings for the wheel covers, forks, and chain cases, sets of three dies only being required in the manufacture of these components. The second feature is the unit construction of the engine and gear; and the third the system of spring suspension at the rear.

The torpedo-shaped tank is built of steel tubing with malleable iron nose and rear pieces, and the tank forms the backbone of the machine. Extending down from the tank are four tubes, two at the front and two at the rear, which engage with four large lugs in the casing forming the engine crank case and the gear unit, and the complete construction forms the central portion of the machine.

An unusual feature exists in the design of the rear part of the machine, in that no tube of any description is used in the construction. The rear wheel is housed within a stamped sheet steel cover, to which is attached on either side a stamped casing forming radius components for the up and down movement of the rear wheel. These latter casings are attached to lugs on either side of the engine and gear box casing by means of side bosses, which are concentric with the gear box countershaft and act as radius rods for the rear wheel. The weight of the rider and the central part of the machine is taken by a pair of laminated springs, extending from lugs on the rear pair of twin tubes under the saddle to sliding joints between the chain cases and the rear wheel cover, as will be seen in the plan view of the transmission system.

How the Rear Wheel is Withdrawn.

Apart from the rear spring suspension system, the rear portion of the machine holds another very interesting feature in the manner in which the back wheel can be detached and taken out. To withdraw the wheel, four castle nuts are unscrewed from lugs on the periphery of the rear wheel cover, and the halves, together with the side cases, are drawn apart to permit of the wheel being taken out backwards, as shown in the illustration. To allow of this operation it is not necessary to remove or disturb the driving chain sprocket or any part of the rear wheel bearing system, except the central bolt of the rear hub, and, when bolted up after the wheel has been inserted, the complete cover of the wheel, together with the casings on both sides, form a box-

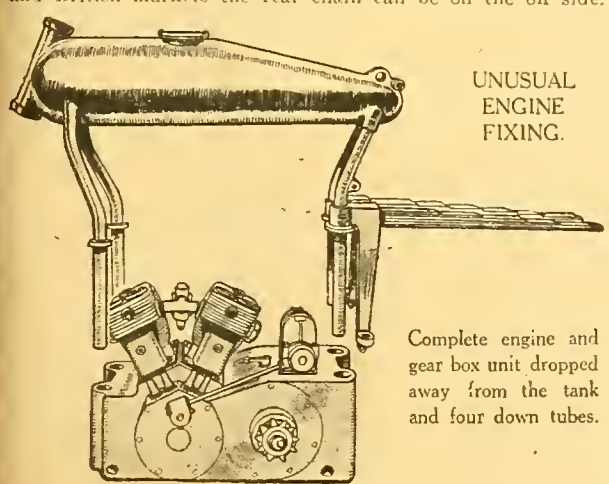


Plan view of speed gear, rear chain transmission and disposition of side casings and rear springs.

Novelty in Design and Construction.—

like construction which should prove to be immensely strong. The manner in which the sprocket drives the rear hub, through an auxiliary sleeve mounted in ball bearings, is shown in another illustration.

From the crankshaft it is intended that a pair of wide Coventry chains extend to the countershaft, and the two speeds are obtained on the P. and M. or Enfield system of different sized sprockets. The crankshaft is to be mounted on roller bearings located within the crankshaft chain sprockets, in order to give the maximum width of flywheels, and at the same time to reduce the overall width of the crankshaft. The crankshaft and its bearings are supported within two large detachable steel discs within the crank case, while a very simple and sturdy form of cam gear has been evolved for the valves. The final drive to the rear wheel is to be by means of a very large roller chain located within the near side case.



Section of rear hub, axle and sprocket drive.

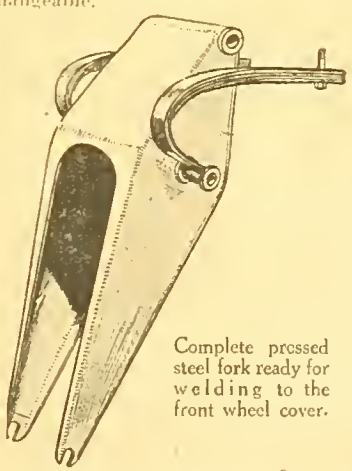
The change-speed gear possesses an unusual feature, in that the low gear is brought into operation by an expanding clutch, while the high gear comes into operation on the engagement of a pair of dogs on the countershaft. The object of this construction has been to eliminate a number of working parts and provide a foolproof mechanism. In the majority of instances it is unnecessary to declutch when changing into top gear, whereas the clutch is always used in starting away with the machine on bottom gear, hence the low gear clutch and high gear dog system employed in the design. Probably changing down will be a matter of practice. The size of chains and sprockets in the two-speed gear unit has been so proportioned to give a guaranteed mileage of 40,000 without replacements, while a similarly large mileage is intended in respect of the fabric facing employed in the low gear expanding clutch face.

Optional Disposition of Final Drive.

It will be observed from the design that no difficulty whatever should be experienced in removing and greasing the rear transmission clutch, since its casing is right on the outside of the machine and completely unobstructed. Incidentally, it should be noted that when the halves of the rear wheel cover are parted for withdrawing the wheel, the outward hinging movement of the chain-case is brought about on the spherical boss concentric with the countershaft on the side of the gear box, to which the casing is attached. Also when the casings are hinged outwards the leaf springs, together with their brackets, perform a similar movement. The illustrations show the rear chain on the near side, but as the casings on both sides of the machine are identical to each other, the chain can be on the near or off side at option, according to sidecar position. Hence for both Continental and British markets the rear chain can be on the off side.

UNUSUAL ENGINE FIXING.

Complete engine and gear box unit dropped away from the tank and four down tubes.



Other features of the engine and gear box unit are a combined hand and foot control for the dog gear and clutch, enclosed valve springs, and magneto driven by shaft and skew gearing from the cam gear.

In order to allow for the engine and gear box to be overhauled as a unit on a workshop bench, the four tubes extending downwards from the tank are provided with fittings which allow the engine to be dropped away from the machine as illustrated, or, in the case of the garage pit not being available, the engine unit can be chocked up on a box and the central part of the frame lifted away from it. It should be mentioned that, if desired, the tank and down tubes can be lifted away and still leave the rear wheel and side casings in position with the engine and gear box, which allows of the whole of the engine and transmission (including the rear wheel) being overhauled and adjusted with ease and comfort.

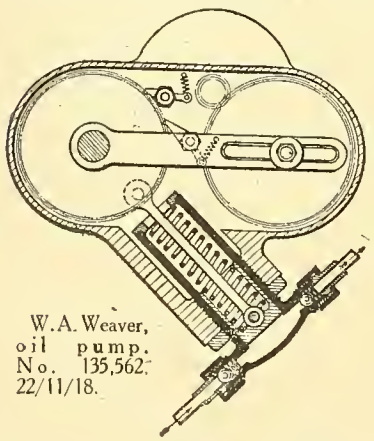
Unique Construction of Front Forks.

The front forks are to be built of two stampings made from one set of dies only, and when welded together in position on the pressed steel cover of the front wheel form a very strong construction. The bolts to which the links are attached have bearings the complete width of the fork, in order to provide lateral rigidity at the front part of the machine over a long period of use. The laminated leaf springs, attached to the cross bolt connected to the lower fork links, are designed to take up the motion of the forks, both in a vertical and fore and aft direction, and the attachment of the top part of the spring is direct to brackets forged underneath the upper fork links. External expanding brakes (totally enclosed) are fitted to both front and rear wheels, and the wheels, incidentally, are interchangeable.

One of the two stampings which form the front fork construction.

Complete pressed steel fork ready for welding to the front wheel cover.

The general and detail design of the machine has been fully worked out by the designer, and, needless to mention, a number of the general features have been made the subject of patents. Provision has been made in the general design for many details, such as dynamo lighting, rear carrier, and a number of points in smaller equipment, and it is hoped that an experimental machine will be placed on the road during the present year, when manufacturing arrangements are to be attempted.



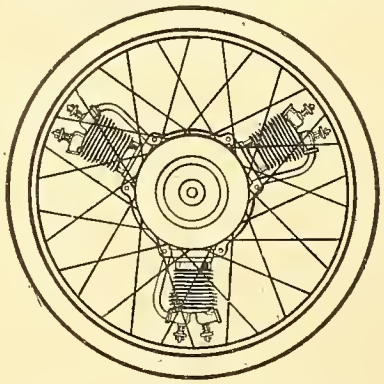
It is, perhaps, curious that in so complete and excellent a design, Capt. Millar should be content with a two-speed gear box providing no method of declutching without resorting to low gear. Such an arrangement might prove distinctly unhandy in traffic, and we expect to see this detail modified in the production model. Except for this criticism, the design is most interesting, and will undoubtedly attract the attention of those who desire a weatherproof machine.

RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

A Mechanical Oil Pump.

I DO not know that I have fallen wildly in love with Mr. Weaver's oil pump. It is obviously designed for a somewhat complex transmission, and, to judge from his specification, is intended to be driven so slowly that a charge of oil is injected into the crank case every five miles or so, though in actual practice both the volume of the charge and the frequency of delivery are adjustable. In other words, it is a mechanical substitute for the ordinary hand pump, and differs from the general run of mechanical pumps, which inject a tiny charge of oil every few yards. Still, if a type of engine is used which requires the cooling effect of a big dose of cold oil every few miles, the Weaver pump would be less trouble-

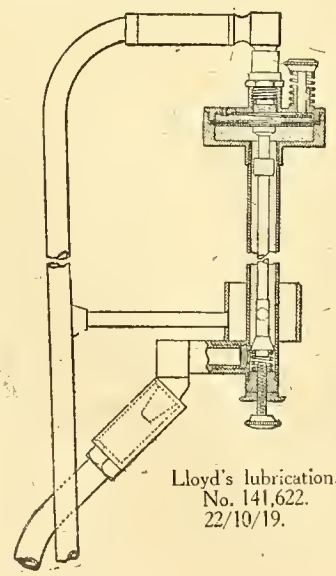


W.A. Weaver, oil pump. No. 135,562. 22/11/18.

some than the hand type. It consists of an ordinary plunger pump fitted to a gear case. The train of gears on the right are driven off the engine in any convenient fashion, and the adjustable horizontal arm is slowly oscillated. A pawl fixed to the arm rotates the toothed crank disc on the left, and a second pawl prevents the disc from flying back. The pump piston is then given a suction stroke, and when this piston passes its dead centre, the coiled spring operates its delivery stroke, whilst the crank disc free wheels. A hand lever, fitted to the spindle of the crank disc, permits the driver to inject extra supplies at his discretion.

A Rotary-engined Wheel.

A Finnish engineer, Mr. Y. J. Aaltonen, propounds a motor wheel, consisting of a three-cylinder rotary engine of the pattern in which the cylinders and crankshaft rotate in opposite directions. The two rotating parts of the engine are coupled together (or disconnected) by means of a friction clutch acting on the planetary wheels of an epicyclic gear. How such a fiendishly heavy wheel would bump on our modern roads! Mr. Aaltonen has apparently done a little "prop-swinging" in his time, for he points out how nice it would be to handle an aero-

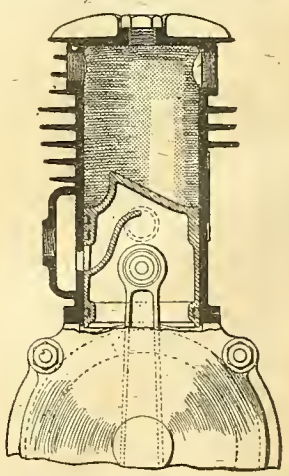


Aaltonen rotary engine. No 142,010.

plane built on his system, and clutch in the prop after the engine had been started. Ack Emmas will agree, but what the design section of the Air Ministry would remark is perhaps unprintable.

An Elaborate Oiling Control.

Mr. W. P. Lloyd proposes to use exhaust pressure for the control of a regulating valve in the case of a gravity fed lubricating system; the chief objections appear to be lack of pressure on the oil. As the sketch indicates, the method is quite simple. The oil in the tank rises to its own level in an oil tube which it reaches through a non-return valve. The oil tube may be located inside the oil tank, or be of the external type, and surrounded



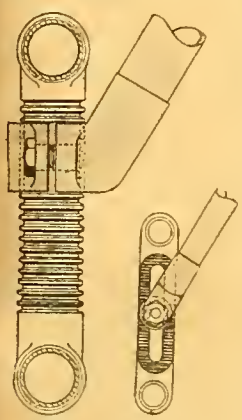
Lloyd's lubrication. No. 141,622. 22/10/19.

with an exhaust-heated jacket. In either case it contains a valve communicating *via* a sight feed glass and a pipe with the crank case; the valve is normally closed by a spring and is adjustable. The head of this valve terminates in a disc, and the disc supports the centre of a leather diaphragm in the exhaust pressure chamber. A by-pass from the main exhaust conveys pressure to the upper side of the diaphragm, whereupon the valve opens, and oil passes through the sight glass. Apart from the possibilities of fouling when the exhaust gas is dirty, the device should work well, for the supply of oil will increase, not only with r.p.m., but also when the engine is running slowly on full throttle on a steep climb.

Two-stroke Piston Cooling.

If the next Dalman two-stroke engine is constructed according to the present patent, it will join the select band of "four port" engines, of which the original Connaught and the Clyno are familiar examples. The fourth port is in the piston skirt, and forms the communica-

C. W. Dalman and J. H. Dalman (Deux Temps), two-stroke. No. 140,173. 17/2/19.

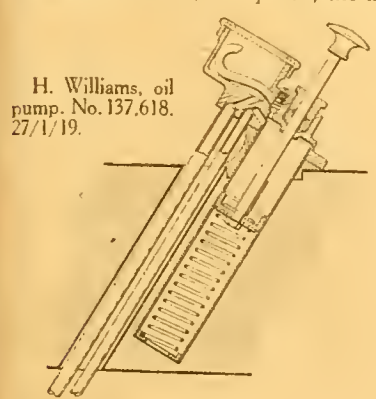


tion trench between the crank case and the transfer passage. I use the word "trench" advisedly, because the subject matter of the patent covers the use of a web or baffle inside the piston; in side view this baffle is a pulled-out S, and in cross view a U; its purpose is to cause the charge to travel along the under side of the piston crown, and so assist in the cooling. It is quite possible that the ordinary type of two-stroke engine maintains a pocket of semi-stagnant gas under the piston head which does not make for cooling the hottest point in the engine. Clearly nothing but careful experiment can prov

Recent Patents.—

whether the present interesting innovation results in increased efficiency. It is certainly possible to keep a well-designed piston reasonably cool without resorting to such expedients. On the other hand adequate charging is always a serious problem with the simpler types of two-stroke engine; and in this case two new obstacles to charging are apparently introduced. One is the additional friction and throttling produced by a devious transfer passage. The other is the additional pre-heating of the charge, which must lead to expansion, though it may produce a better mixture with less "blobbiness." Messrs. Dalman have presumably satisfied themselves that the gain exceeds the losses.

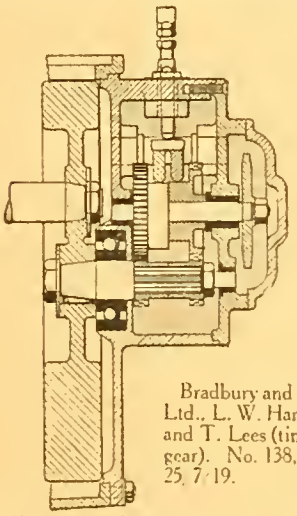
Non-slipping Sidecar Connections.



Sidecars have grown so ponderous and speedy that frictional locks have ceased to be satisfactory for fixing the adjustments of the connections to the cycle frame. Mr. G. E. Rigby protects the use of bolts passing through the eyes of the connecting tubes and through slots in the sidecar chassis, slip being prevented by corrugating the surface round the slot, and using a serrated washer in contact with the slot. Alternatively, he uses grooved lugs on the chassis, and an internally grooved clip on the end of the connecting tube.

G. E. Rigby, sidecar attachments. No. 137,385. 21/1/19.

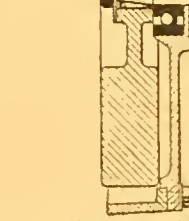
Hand and Mechanical Lubrication.



Mr. H. Williams propounds a hand pump for use in conjunction with the Best mechanical pump. He couples a pipe from the engine-driven pump to the cylinder of the hand pump between the valves of the latter. The engine pump then draws oil through the barrel of the hand pump, and forces it through the sight feed of the hand pump. When additional oil is required, the hand pump is used to augment the supply. A single indicator and a single pair of valves thus serve both the lubricating systems.

H. Williams, oil pump. No. 137,618. 27/1/19.

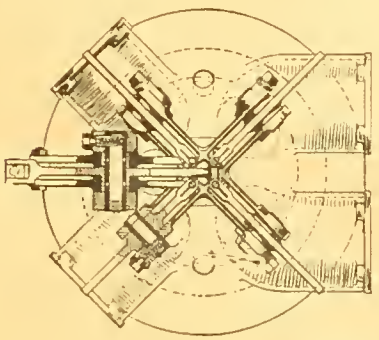
Adjustable Cam Gear.



The Bradbury valve gear, illustrated herewith, will arouse fierce glee in the bosom of the expert knut, for it enables him to set his timing to $\frac{1}{720}$th of a circle, or less than a degree. The crankshaft is externally serrated, and drives two half-time pinions, each of which is internally serrated, and operates one of the cam wheels. The exhaust cam wheel is made in one piece with its spindle, and the inlet cam wheel runs free on the same spindle, outside the exhaust cam. Assuming pinions with sixteen and thirty-two teeth respectively, and fifteen serrations in the internal bore of the half-time pinions, the timing can be set to $\frac{1}{720}$th of a circle. Whether the novice who rashly dismounts his timing gear will prefer this pattern to the ordinary three-pinion type with nice punch marks remains to be seen.

Bradbury and Co., Ltd., L. W. Harvey, and T. Lees (timing gear). No. 138,555. 25/7/19.

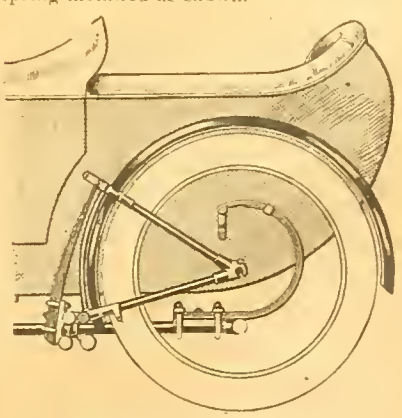
Gudgeon Pin Fixing.



Without doubt an easily removable gudgeon pin is welcomed by those motor cyclists who are inveterate "tinkerers"; we have to remove carbon from the inside of the piston, and the removal of the gudgeon pin is a delicate job when it is a driving fit in a light piston. The name of the devices which secure gudgeon pins is legion, proving that it is no easy matter to combine detachability with security. Mr. W. Caddick, in conjunction with the Ruby Cycle Company, protects the use of bronze set screws, screwing into either end of a gudgeon pin. The piston is so recessed that the heads of the set screws definitely locate the gudgeon pin. This is a variation of the not uncommon system by which floating caps of soft metal are placed between the cylinder walls and the ends of the gudgeon pin. I have never had any trouble with the simpler device; but provided that the set screws are of a metal which expands under heat to a greater degree than the steel pin, this patent should be satisfactory.

Royal Ruby, gudgeon pin. No. 141,570.

A Four-valve Head.



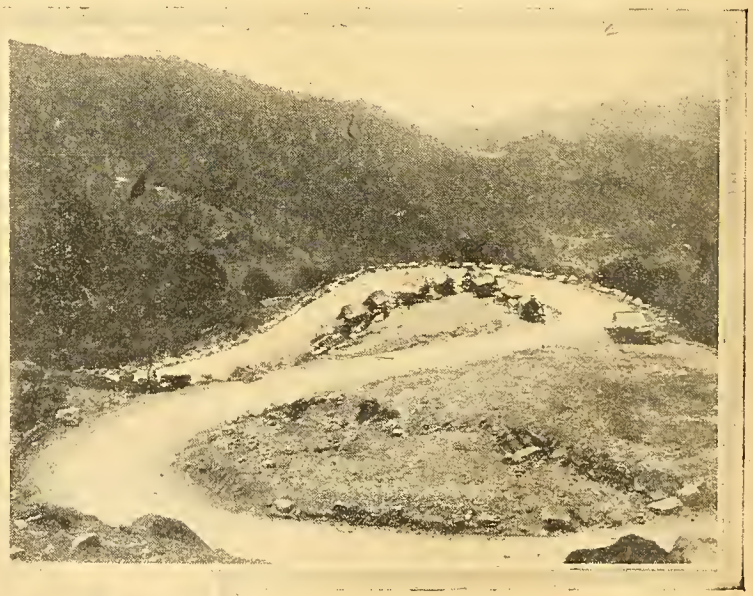
Messrs. Stevenson and Smith, of the Royal Aircraft Establishment, are concerned with the multi-valve engine. No doubt aero engines were in their mind, but any amateur mechanic who is faking up a 2½ h.p. J.A.P. into a sixteen-valver with an eye to the Baby T.T. should study their lovely arrangement. For four valves per cylinder (two inlets and two exhausts), they use one pivot bracket and two pull rods. These are so ingeniously devised that, as the plan shows, the two primary rockers operate four secondary rockers, the business ends of which are set equidistant round the central point of the head. Very neat, too.

A. C. Stevenson and W. S. Smith, valve operating gear. No. 139,894. 14/3/19.

Sidecar Wheel Springing.

Mr. W. F. Lechmere and the James Co. patent a spring sidecar wheel, the character of which is obvious from the drawing. The sidecar body is sprung by any approved method. The sidecar wheel is carried in a separate triangulated frame, rocking on a broad pivot pin mounted on the transverse tube which secures the sidecar to the motor bicycle. The upward movement of the side wheel frame is damped and finally checked by a leaf spring mounted as shown.

W. F. Lechmere and the James Cycle Co., spring sidecar wheel. No. 140,160. 1/2/19.



OVERSEAS SECTION

Commentary based upon Practical Experience and a Study of Overseas Opinions.

Useful Statistics. LAST week we analysed the Board of Trade Returns of overseas trading figures for 1920. and several striking facts were brought to light. Of course, the most satisfactory finding was the extraordinarily high ratio of motor cycle exports to imports, especially when compared with the corresponding figures for cars, and, remembering that £2.340.557 worth of motor cycles and parts were exported in twelve months. it will not be permissible now for our overseas readers to complain that they are *quite* neglected by the home manufacturers.

But that is not all that the statistics reveal. By the use of a little simple division and equally simple deduction it may be inferred that a high proportion of the number of complete motor cycles exported were lightweights—and low-priced lightweights at that.

The Motor Cycle has frequently drawn attention to the great potential demand for such lightweights from the widely diffused populations of many countries abroad. Is this demand being satisfied now? Both by the B.O.T. figures and by other sources of information we are constrained to answer in the affirmative. But although many makers have turned an attentive ear to this particular market, supply cannot yet have gained on demand; and each year the latter factor gains in dimensions. The higher priced and higher quality lightweight must be dealt with as a proposition distinct from the above question. It must not be regarded as a plaything or a toy for either native or European; and, regardless of conditions, we re-affirm that the variably geared *de luxe* lightweight machine is a sound utility mount wherever the use of the motor cycle, of any type, is at all possible. Undoubtedly a number of the 21,000 machines that went abroad last year were of this type. We await with interest the verdict of the hard rider under difficult riding conditions.

ON AN INDIAN FRONTIER

North-west India is the country of great road engineering feats. In the Alps of Central Europe and in the Rockies of America are to be found fine mountain roads, but India can boast also of long and well-graded climbs over wild and very rugged country. These two photographs show hairpin bends on the road to Kashmir, a climb of ten miles. A Triumph and sidecar accomplished the climb when our photographs were taken A timed hill-climb from the bottom to the top of this little rise would surprise a good many owners who pride themselves on their machines and their own hill-climbing abilities

Overseas Section.—

Springing. THE development of motor cycle springing has taken a curious turn, for though the necessity for increased comfort is still fully realised, the majority of present day designers seem content to insulate the rider and to leave the machine to take the shocks. Spring seat-pillars and saddle suspensions have progressed by such leaps and bounds that the insulation of engine frame and transmission appears to be in danger of becoming side tracked. There are many difficulties in the way of designing a perfect spring frame motor cycle, for in addition to a wide range of action with absence of side play or roll, it is necessary to maintain as nearly as possible a constant tension on the transmission. It is not generally realised that the slight variations in sprocket centres to be found in most rear springing systems matter less than the "snatch" imposed by the sudden lifting of that section of chain directly over the top of the large rear sprocket. Anyone who cares to make a rough diagram will see clearly that if a stationary sprocket of considerable size be swung about the axis of the driving sprocket, that driving sprocket will be partially rotated, and since this happens to a greater or less degree when any inequality in the road is struck one may imagine the effect on the transmission system. Equal sized driving and driven sprockets will alleviate the trouble, but these are seldom possible in the case of motor cycles. In spite of these difficulties we are convinced that the correct springing of motor cycles will develop, and that it is only a matter of time before rigid frames will be the exception rather than the rule.

Japanese are quick to recognise the qualities of anything from the West, whether it be of machinery or sport, and although motor cycling is a comparatively new pastime in Japan, a T.T. race has already been held. The photograph depicts S. Yokokawa (Triumph) winner of the event, which was held over a ten-mile course.

Cycle Cars for Overseas Markets. UNDER the present system of taxation the small four-wheeled runabouts of motor cycle specification are likely to encounter an adverse period on the home market, yet no one has seriously estimated their possibilities in more distant fields. In the great Dominion cities, of course, conditions are much the same as in our own towns, and any type of machine will find its buyers, but in the pioneer districts assuredly the monocar type of four-wheeler has special claims for attention. It is light, powerful for its weight, has a narrow track, and, usually, a generous clearance for its underworks. On half-made dirt tracks, probably deeply rutted by horse or bullock transport, its narrow track should enable a safe course to be maintained between the wheel tracks of the heavy traffic in circumstances where a three-wheeler would be at a considerable disadvantage.

The light four-wheeled single-seater is narrow enough to take to a bush track, and can be lifted over those obstacles which stop a solo machine or ditch a car. Another advantage of the cycle car machines is the simplicity of construction; a motor cycle engine, gear box, and transmission are easily understood and cheaply maintained when they are run in an enclosed position. The chassis, instead of being a complicated and delicately aligned system of brazed tubes, may be of wood and cheaply assembled; even if of the brazed tubular type it may be understood and repaired by any village blacksmith or backwoods handy man, simply because it needs to be little more than a rectangular framework embodying the simplest of lugs.

A Selection of Letters from Readers scattered all over the World.

An Oriental Opinion.

A Japanese correspondent, who signs himself with a native registration mark (which, fortunately, he translates, for it is beyond the capacity of our printing presses!), sends us the following decisive if somewhat original views of his own tastes, especially with reference to earlier statements by "Ixion":

"Your contributor, 'Ixion,' in the issue of October 21st, 1920, gives us to understand that a two-stroke of a certain make grows on us for ever, or we sell it in six months. . . Fools suck joy out of four-strokes; two-strokes are for the clever rider, etc.

"I had a Scott for four years, then I sold it. I have a Bradbury now, and like it better. I prefer grinding valves to cleaning out transfer ports. I like independent adjustment for chains. I prefer to stay at home, when it is wet, to carting around so much sheet metal on my outfit, in anticipation of a deluge.

"'Ixion' must have been listening for misfires at low speeds and high speeds when his three tool rolls left home. Sewing the roll to the bag is nonsense: if it is wanted at the front wheel, it means emptying the roll, or too many trips to the roll. Pack your pannier bags tightly, make sure you fasten them, and you will not need to sew anything, and you will not sow your outfit of tools."

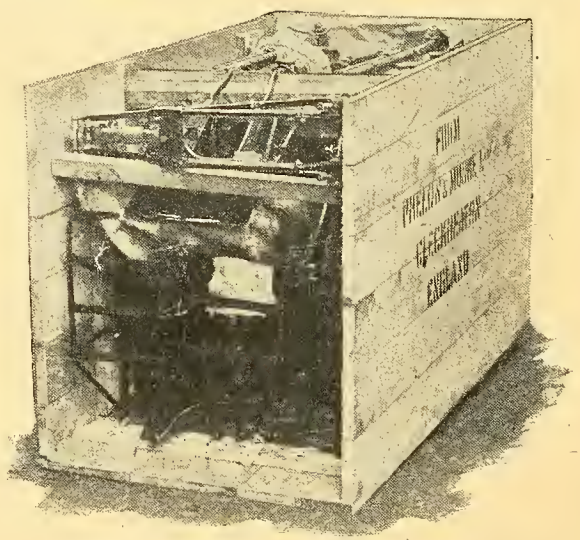
Mail Orders for Accessories.

A resident of Northern Rhodesia, in a letter received this week, draws attention to the possible sale of small articles through the post, and, like many other Overseas readers, no doubt, requires more information than is contained in the average advertisement.

"To read many of the advertisements in *The Motor Cycle*," he writes, "one would think that either the advertisers are indifferent about selling their goods to people living abroad, or must imagine that your popular and widely-read journal does not circulate outside the United Kingdom.

"These advertisements often do not give the price of the article advertised, and rarely, if ever, state the foreign

Overseas Section.—



postage on it. This is most inconvenient to people living abroad, as it often takes four months to get a reply to an enquiry, and twice this time to get delivery of the article which may be wanted.

"If the reason for not stating the postage to foreign countries is that it varies too much, surely the advertisers might take a sum equal to the average cost of the postage to the principal colonies, and be satisfied with this. They might lose a few pence on one parcel, but would gain as many on another.

"I think a good deal of trade by post with the colonies must be lost through advertisers failing to state clearly in their advertisements the essential facts about an article one wants to know, *e.g.*, a description and, if possible, illustration of it, its cost, and the postage on it to any part of the world."

The Movement in Jamaica.

Writing from Jamaica a reader, who is about to form a Jamaican motor cycle club, says: "We feel that in inaugurating a club of this sort it would possibly be the means of getting into touch with the manufacturers of English machines, as we feel that the English machine—owing to quite a number of reasons—has not been fairly represented in this country. For instance, its geographical position affects the situation to a certain extent on account of its close proximity to America and the easy method of procuring machines, as against the almost insurmountable difficulties of procuring English makes during the war, owing to the output of English manufacturers being restricted and diverted to Government work. The leeway lost on account of these reasons gave American manufacturers a wonderful chance to flood the market, and today we would say 90% of the motor cycles in Jamaica are represented by American makes. But we feel that, although this regrettable position could not be avoided, if the English manufacturers combined together and made strong representation here, there would be quite a considerable amount of business that they could still obtain. Owing to the popularity of the American machine, the motoring public here has become educated to the idea of having a very powerful engine. Most of the machines are rated at 8 and 10 h.p., and some as high as 16 h.p.; and, although we feel that we want plenty of power in this country, a machine of this kind, except for use with a sidecar, is really too powerful for solo riding. The Harley-Davidson and the Indian practically number four to one of any of the other machines, and, as you know, these are very powerful engines, ranging from 8 to 12 h.p. While on this subject, perhaps it would be as well to point out to you that these makes sell here for around £130 solo and £180 with sidecar, so the English 4 to 6 h.p. would have to sell here for about that figure, or possibly less, so as to enable them to get a strong hold on the market. In connection with this club, we propose to have motor cycle tours, and, possibly, if it could be arranged, speed trials—the same as you have in England—the machines being rated as to horse-power, size, and so on."

How British motor cycles are packed for abroad. A case measuring only 4ft. 6in. × 2ft. 6½in. × 2ft. 1lin., which contains two complete P. and M. motor cycles

Urban Requirements in Australia.

MR. A. MARSHALL, of Sydney, New South Wales, writes: "As an Australian reader of your excellent paper, I would like you to publish some of my opinions.

"There is one thing I have noticed in your Overseas Supplement. All the advertisers stress the fact that their articles are of 'special interest to Overseas riders.' They omit, however; to state the price of their product. What, to my mind, would be a good idea would be to publish the approximate price of their product in the different countries for which they are suitable.

"If any of the well-known motor cycles which are cheap in England were imported into Australia (with spare parts) they would find a ready market, provided, of course, they were reasonably priced. There are many potential purchasers of motor cycles who, at present, are riding push bicycles, and who are prepared to pay a moderate price for a simple, fool-proof motor cycle that will climb hills and not fall to pieces after a few miles on our 'roads.' I think it will be found that push cyclists become the best motor cyclists, owing to the experience they gain whilst push cycling. They know where they can squeeze through, and also where they cannot, and they know how to dodge people.

"In conclusion, I might mention that Harleys predominate here in our races and competitions. One exception, and a startling one, is the Sunbeam, a post-war model, with A. Biden, of Biden and Roberts, the Sydney agents, in the saddle. This machine is beginning to wake things up for the English makers (they do not know what a good thing they are losing), but it should be expected by those who ever read reports of English trials.

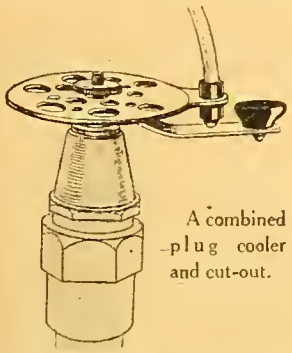
"Please do not encourage scooters to be sent out here. We had a few, but they did not catch on. We want cheap, good British motor cycles.

"I hope I have not bored you with my long letter, and wish you and your paper every success. A finer publication I do not know."

Shaft Drive in India.

A shaft drive enthusiast in Palapilly, South India, is disappointed that British manufacturers do not market a machine with this form of drive. He writes: "In these parts one is very glad to see your fascinating little paper, and I was interested in the account of the fine show at Olympia; but I must confess to being disappointed to see that British makers still prefer to cling to the old chain-cum-belt or all-chain drive, instead of adopting something more up to date.

"Having done a fair lot of motoring and motor cycling (a bit over 80,000 miles of the latter) on all sorts of machines and roads, and under nearly every kind of condition, I go back to an old—probably 1911—model F.N., and I have no hesitation in saying I consider there is not, so far as I know, a cleaner, neater, sweeter, running drive; and last, but not least, it is a real no-trouble form of transmission. I may mention my present F.N., judging from the state of all nuts, screw heads, piston, gudgeon pin, mainshaft bushes, fly-wheel casing, etc., may have been about twentieth-hand when I bought it, and could it speak more eloquently than its apparent condition, it would disclose a harrowing story of its maltreatment by many fools for at least eight and a half years! My only reason for desiring it was my love for shaft transmission, coupled with the fact that a careful examination of its gears and pinions showed them to be as good as on the day they were put in.



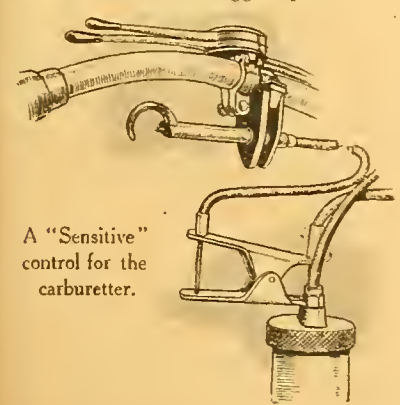
"The transmission I consider next best to that of the F.N. is the worm drive to countershaft, and a chain thence to the rear wheel. This I had on a Starley two-speed machine with 2¾ h.p. Minerva engine, and all I need say about it is that it never needed any adjustment in the 10,600 miles of enjoyable riding I did on it. This was in 1908, and you doubtless remember it had a large worm-wheel reducing the gear to 5⅛ to 1 for top speed at the countershaft, equal sized sprockets on countershaft and rear wheel, making a particularly sweet and silent drive *for a chain*.

"In connection with wheels, I am pleased to notice that some makers have at last broken away from their conservatism, and are fitting 28in. wheels."

A COMBINATION PLUG COOLER AND CUT-OUT.

A NOVEL accessory has recently been placed on the market by Richards Patents, 16, Manor Gardens, Richmond, Surrey. The device consists of a perforated disc which is placed over the sparking plug terminal and acts not only as a plug cooler but as a holder for carrying a fibre bush in which the high-tension wire is held.

The current is carried through a metal strip connected to the plug which lies immediately beneath and is in contact with the high-tension wire. By pressing a small knob at the end of this strip the circuit to the plug is cut off and the plug rendered inoperative. When pressure on the knob is discontinued, the strip springs back and connects the high-tension wire to the plug.

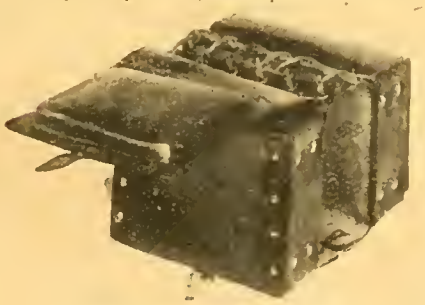


A combined plug cooler and cut-out.

A SENSITIVE THROTTLE CONTROL.

ALTHOUGH the motor cyclist may be loth to encumber his machine with any more cables than those which already adorn most handle-bars and steering heads, there appears to be some excuse for a device which will be conducive to easier driving.

In this category must be placed the Unity "Sensitive" Control, made by Messrs. Kerslake, Ltd., of Putney. This device may best be described as a finger-operated accelerator, and it is ingenious, in that it does not involve any alterations or interferences with the existing throttle control. Briefly, the accessory consists of a finger trigger attached to the handle-bar near one of the grips by a universal ball and socket arrangement; this trigger pulls on a Bowden wire and operates a small lever device on the carburetter, which in turn lifts up the end of the throttle cable outer casing. This being so, the inner wire (to which is attached the throttle barrel) is also pulled up; thus the throttle is raised without disturbing the relative distance between the ends of the inner and outer wires which is controlled by the setting of the ordinary handle-bar throttle lever.

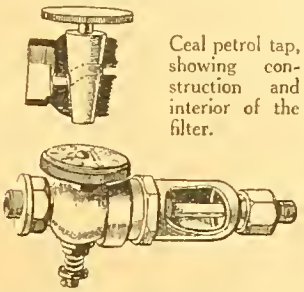


In practice the throttle is set to give a certain speed (as, for instance, a slow tick over with clutch disengaged), and the sensitive control is then operated for all higher speeds: the instant it is released, however, the throttle flies back to the predetermined position controlled by the throttle lever. For traffic riding such a control should be invaluable.

A "Sensitive" control for the carburetter.

PANNIER-BAG KNEE-GRIPS.

AN accessory which usefully fulfils a dual role is to be welcomed, especially by those riders who dislike the crowding of their machines with anything but essentials. Such a fitment is the pannier knee-grips, made by the Betorl Leather Co., Ltd., of 56, Seel Street, Liverpool. This consists of two rectangular pouches, with padded fronts, which are fixed by laces, as are most devices of this kind. Besides providing a satisfactory grip upon the tank, they are sufficiently roomy to accommodate a repair outfit, dry battery for rear or inspection lamp, or a useful assortment of small tools. The grips are made of brown leather, the front end of the pouches being stiffened while the rear ends are soft to allow the grips to give to the pressure of the rider's knees.



Combined pannier bags and knee-grips made by the Betorl Leather Co., Ltd., of Liverpool

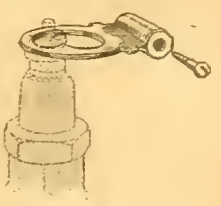
AN INGENIOUS PETROL TAP LOCK.

WHILE not absolutely thief-proof the invention under review should certainly ensure the safe leaving of a motor bicycle outside a shop for a reasonable time, as it is virtually impossible to turn on the petrol unless the thief is let into the secret. The coned barrel of the tap is drilled in such a manner that it can only be opened in one position. This position can be marked by any figure, or by any space between a figure, by means of the celluloid disc which can be rotated independently of the milled screw which turns on the tap.

Anyone attempting to start the machine would naturally suppose that the "on" position is opposite one of the figures. It is quite conceivable that the owner of the machine might set the disc with the tap opening pointing to a quarter of the way, say, between 3 and 4. Such a position would take time to discover.

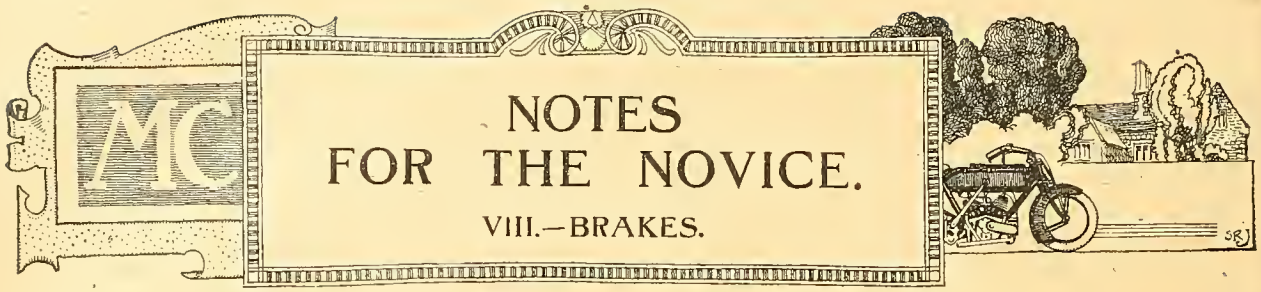
Ceal petrol tap, showing construction and interior of the filter.

Naturally with the device in question any position of the disc might be chosen. The secret of turning on the tap is practically impossible to unravel. The tap has a sump below it with a pipe projecting some way up in the centre so that any foreign matter remains at the bottom, thus providing an effective filter. The proprietors are Messrs. Chandler and Lowe, 4, Carlton Terrace, Child's Hill, Cricklewood, N.W.



WEATHER-PROOF CLOTHING.

RECENTLY we have been testing some waterproof garments made by Messrs. J. Taylor and Sons, of New Park Street Mills, Leeds. The material used is a leather cloth which has all the appearance of leather itself, until a close inspection reveals the fact that the material is a fabric with a waterproof face. During the London-Exeter run, a double-breasted trench coat and a sleeved waistcoat were worn, and as both these were lined with fleece and equipped with wind-cuffs, neither cold nor rain caused any inconvenience, so far as penetration of these garments was concerned. To complete the equipment ordinary oil-skin leggings, trench boots, and a leather helmet were worn. The helmet became soaked, and there would appear to be a good opening for a helmet made of the I.T.S. material.



The trench coat, besides having the appearance of leather, is smartly cut, with belt and slit pockets, and the collar when turned up protects the lower part of the face.

A SPRING TERMINAL.

MADE by the Apollo Plug Manufacturing Co., Ltd., of Moseley Street, Birmingham, the snap-on high-tension terminal illustrated is stamped from a single sheet of brass. It consists of two superimposed "button-holes," which are slightly staggered, so that they grip the flange of the plug nut tightly when pulled into place; the terminal nut is inverted.

Apollo snap-on terminal.

NOTES FOR THE NOVICE.

VIII.—BRAKES.

(*Continued from page 520*).

THE earlier motor cycles were fitted with brakes copied from the pedal cycle. This was unfortunate, but not surprising. What is surprising and still more unfortunate is the fact that these brakes still survive on the front wheels of many makes. A brake which operates upon the wheel rim has proved effective in pedal cycle practice where the weights are low, but it has never been a real success on a motor cycle, though it must be granted that some examples of this construction are very much better than others.

I have seen brake blocks which were so badly fitted that on the first application they turned round on their stirrups and either went out of action entirely or caught on their spokes. Such things bring credit to no one.

Belt Rim Brakes.

Very soon a great improvement was made—so far as the rear wheel was concerned—by applying the brake to the belt rim, a dummy rim being fitted expressly for this purpose in the case of hub gear models and chain-driven machines. The arm carrying the brake block is pivoted to a bracket attached to the lower members of the rear part of the frame; this bracket is often passed through a slot so that it can be moved backwards or forwards to allow of chain adjustment. The brake block can be either above or below the pivot. When it is fitted above the pivot less force is required from the rider in the application of the brake, as the action of the revolving wheel tends to keep the brake block in contact with the belt rim. It is important, however, that too much advantage should not be taken of this tendency, or the revolving wheel will so greatly increase brake pressure that the brake will be inclined to jam and lock the wheel; for the friction of the wheel against the brake, and the increased brake pressure caused by it, will act progressively upon each other until the wheel is made to skid.

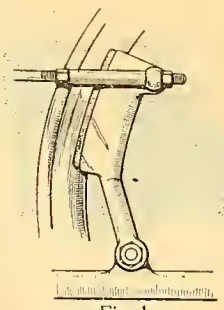


Fig. 1.

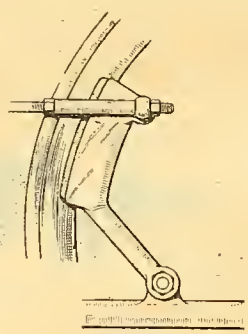

Fig. 2.

(Right) The brake pivot in a normal position and (Left) In a position giving an excessive leverage.

Why Brakes Jam.

A jammed brake is liable to happen when the pivot on which the brake swings is placed too far away from the belt rim, as shown in the accompanying sketches, where fig. 1 shows a reasonable addition to the leverage, and fig. 2 an excessive and dangerous amount.

The best belt rim brakes are applied always along their entire length, which may be as much as six inches, although several modern designs incorporate a compensating action.

I have occasionally heard complaints that the brake which works inside the V of the belt rim is inclined to jam, but, though I have used such brakes for many years, I have never experienced this defect, and I am inclined to think the trouble, when present, is not caused by the brake block being inside the rim, but is due to the faulty design to which I have just referred.

After the belt rim brake had been in use for some little time on the rear wheel it was adapted to the front wheel also, first by Messrs. Lea and Francis, afterwards by the Enfield Cycle Co. and the Birmingham Small Arms Co., and it proved to be a great improvement. When used on a front wheel it is of course not advisable that a brake should be so powerful as when used on the rear, for it would never do to fit a brake which would cause the front wheel to skid, for front wheel skids mean certain falls.

The belt rim brake, then, as applied to front wheels, is always made less powerful, and this occasionally causes unthinking riders to say that it is no good, but this is quite a mistaken idea. When properly adjusted the front wheel belt rim brake is quite as powerful as it should be.

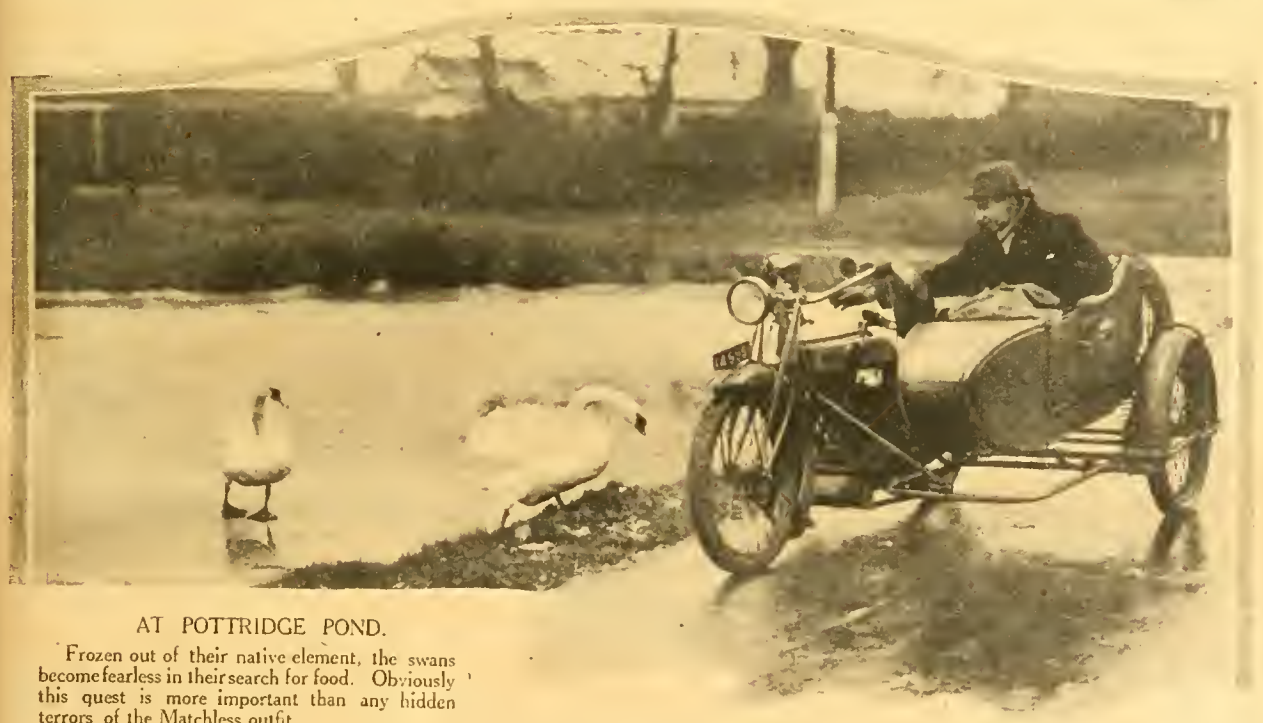
Car Type Brakes.

From time to time contracting band brakes have been fitted to motor cycles, but these have not always proved to be up to the work which they were called upon to do, and the band was apt to touch the drum when it should have been clear of it.

Some up-to-date firms have fitted the internal expanding brakes, and these, when lined with Ferodo or some other similar lining, have turned out to be most effective in all respects. They are powerful but smooth in action, and not very apt to admit dirt; moreover, they wear well, and do not rub when in the off position.

These brakes are commoner on the rear wheel than on the front, but on a few machines they are fitted to both wheels. It is just as well that the drum on the front wheel should be somewhat smaller than that on the back, as that, combined with the fact that the rear brake is generally foot-operated, while the front brake is applied by hand, will make it less

Notes for the Novice —



powerful. One occasionally notices that small bits of grit get between the drum and the inner metal part which carries the expanding parts. This does no particular harm, but gives rise to an occasional tinkle such as can be produced by tapping a cycle bell with the finger nails. It can be removed by running a piece of stiff paper or thin card round between the parts.

On chain-driven machines it is obvious that any adjustment of the chain made by moving the rear wheel backwards or forwards must be accompanied by a corresponding adjustment of the brakes and brake-rods.

At one time it was common practice to mount the brake pedals upon the footrests, and consequently they were often put out of action by a fall; now they are generally mounted on special lugs of their own, and placed out of harm's way—a much more satisfactory method—and seldom suffer damage should the machine be upset.

A periodical examination of the brakework is very desirable, as in an emergency much may depend upon an efficient brake. It is not only in hilly country that brakes may be urgently needed. J.H.W.

AT POTTRIDGE POND.

Frozen out of their native element, the swans become fearless in their search for food. Obviously this quest is more important than any hidden terrors of the Matchless outfit.

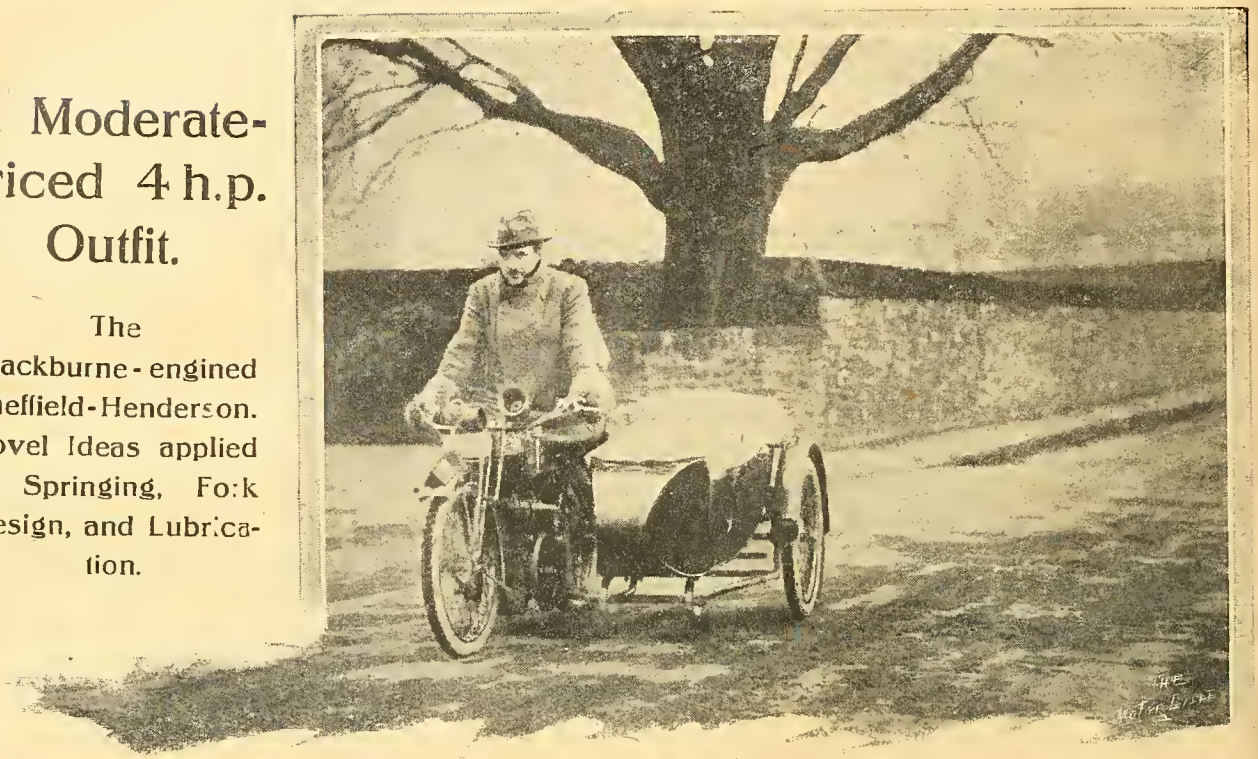
MAGNETOS.

A New Edition of a Much Appreciated Book.

VERY hazy is the average motor-cyclist's idea of the inner workings of the magneto. Admittedly, the modern magneto is the very essence of reliability, and, provided the contact breaker points open and close evenly and at the correct time, practically nothing can prevent the current getting to the plug. "Practically," however, does not mean absolute immunity from elusive magneto trouble, and we think it just as desirable that the rider should carry a working knowledge of the principles of his ignition as it is to carry a spare valve in these days of stainless steel. It is also somewhat of an anomaly to know every detail of a machine and yet to be ignorant of exactly how the vital spark is produced.

The need for a volume devoted exclusively to ignition has been amply proved by the success of the first edition of "Magnetos" (by A. P. Young, A.M.I.E.E., and published by Iliffe and Sons Ltd., London); and in consequence the second enlarged and revised edition should meet with even greater success than the first, which was quickly absorbed.

Magnetos for all types of internal combustion engines are dealt with in a readable and yet complete and exhaustive manner: but motor cycle instruments appear to receive special attention in the new edition. Primarily written for those who have little or no electrical knowledge, the treatise should appeal to the vast majority of engine users—and there must be few who could not learn anything from it.



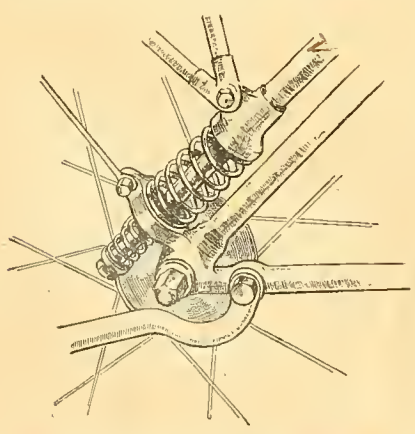
The illustrations are as they should be in a volume of this nature, clear, helpful, and interesting.

The chapter on locating ignition faults may resemble in its "frightening" qualities patent medicine advertisements, but nevertheless it deserves close perusal.

Taken all round, it is a most useful addition to the catalogue of motoring handbooks.

A Moderate-priced 4 h.p. Outfit.

The Blackburne-engined Sheffield-Henderson. Novel Ideas applied to Springing, Fork Design, and Lubrication.

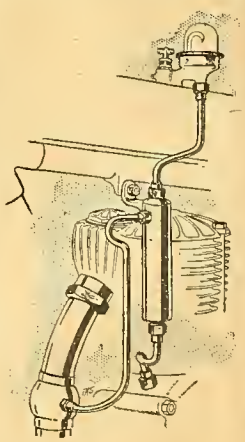


SPECIFICATION

ENGINE: 4 h.p. Blackburne (85 × 88 mm. = 499 c.c.).
GEAR BOX: Sturmey-Archer three-speed.
TRANSMISSION: Chain.
FRAME: Sloping top tube, saddle and carrier sprung.
FORKS: Henderson leaf-spring.
CARBURETTER: Amac.
MAGNETO: Runbaken.
LUBRICATION: Exhaust operated drip feed.
TYRES: 26 × 2½in.
SIDECAR: Henderson standard model.
PRICE (complete outfit): £150.

IN these days any effort to keep down the price of mediumweight outfits is to be commended, especially when that effort is combined with progress in design.

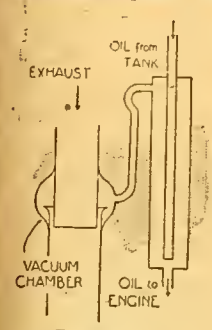
A machine produced to a price is all too often the cheapest possiblo assembly of the cheapest obtainable parts, and as such its life on the market is apt to be short. Genuine reduction of production costs by carefully calculated detail design alone can end in the truly moderately priced machine.



Rear fork end, showing the spring-supported saddle and carrier stays.

These ideas no doubt actuated Mr. L. B. Henderson, of Henderson Sidecars, Fitzwilliam Street, Sheffield, when he laid down his plans for the machine which was first shown at Olympia in December last. Its construction betrays no slavish copying of accepted designs, yet it is in no way unconventional; and, although standard power and transmission units are employed, they are not allowed to dominate the layout. These items were incorporated because it was justly concluded that, as specialist productions of universal success, they were ultimately cheaper than components specially produced on a small scale for the requirements of a single make.

Sound Frame Design.



The frame and forks of the Sheffield-Henderson call for most attention, since they embody a number of features worthy of close examination. A compact sloping top tube frame, with saddle tank, is employed, and it is chiefly remarkable for the size of the steering-head. This item fulfils a requirement often demanded in the pages of *The Motor Cycle*, in that it employs large diameter cup and cone ball races which use ¼in. balls; indeed, the same cups as those used in the Henderson sidecar wheels are interchangeable with those in the steering-head. In addition to the steering column itself, there are two external members parallel with it, and the lower extremities of these terminate in the bearing studs of the front fork swinging links. There are no upper links to the forks, since the single-leaf scroll springs which are bolted to the fork crown are attached directly to the top cross spindle of the fork girder. These springs permit the forks to move up or down and backward and forward, but their inherent lateral stiffness prevents sideways motion of the fork.

To the top of the steering column members the handlebar is rigidly bolted; this construction makes for great strength, and the large head bearings, combined with the triplicate steer-

The Sheffield-Henderson automatic engine oiling system

A Moderate-priced 4 h.p. Outfit.—

Diagrammatic arrangement of the exhaust-operated oil feed.

ing head, should be unusually well able to withstand sidecar stresses.

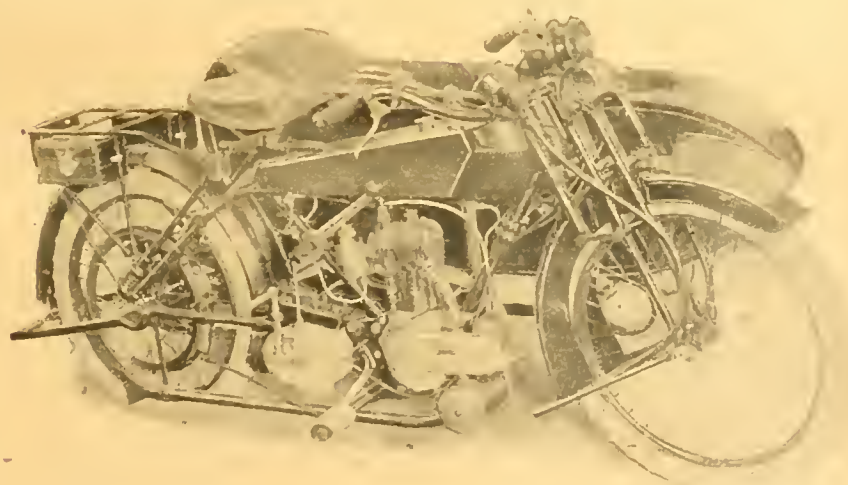
Insulating Saddle and Carrier.

Instead of attempting to provide a completely sprung machine, the makers of the Sheffield-Henderson take a course which is less beset with pitfalls, and mount the saddle and carrier upon a spring-supported portion of the frame. The construction is simple and efficient, and consists of a cantilever saddle-pillar hinged to the sloping top tube of the frame. The end of this is T shaped, and connected on each side to a tubular member which passes through an abutment formed integrally with the rear fork ends. Coil compression and recoil springs taking their bearing against this abutment limit the plunger action of the tubes, to which also the carrier is secured. Adjustment to suit riders of varying weight is obtained by moving the saddle backward or forward on its pillar; while it will be seen that rider, carrier and contents, rear number plate and toolbags are supported on springs.

Automatically Controlled Lubrication.

As before mentioned, the power unit is a standard 499 c.c. Blackburne engine, and it does not call for any special comment. The lubrication system, however, is one which has been designed for the Sheffield-Henderson machine, and it is specially interesting in its adaptation of a well-known principle to serve a particular requirement.

An effort has been made to render the oil supply to the engine proportionate to the throttle opening rather than to speed, as is usually done in the case of automatically-operated systems. The control is quite independent of the rider's attention once the drip feed regulator has been set to suit the weather conditions or the thickness of the oil. The governing factor in the Henderson system is the amount of gas passing down the exhaust pipe, this, of course, in its turn being dependent upon the extent of the throttle opening. The apparatus is designed and works as follows: A short distance from the port the exhaust pipe terminates, and its end projects slightly into another bell-mouthed pipe which leads to the silencer. This arrangement forms an injector, and the junction of the two pipes is surrounded by a small annular chamber, which, owing to the injector action, becomes exhausted of air while the engine is running. The remaining part of the system consists of a plain Enots sight feed, with regulator mounted on the tank; the delivery pipe of this extends almost to the bottom of a metal cylinder depending vertically from the lower tank tube of the frame. There are two outlets from this cylinder, one (at the top) being connected to the vacuum chamber, while that at the bottom is led to the usual oil union and ball valve on the crank case.



When the engine is running the air in the oil-pipe cylinder is almost immediately exhausted, and oil flows from the tank, passing by gravity to the engine; the wider the throttle opening the greater the depression in the exhaust pipe vacuum chamber, and the greater the flow of oil induced.

The Machine on the Road.

Recently we had the opportunity of testing the Sheffield-Henderson outfit on the rough roads and hills in the district surrounding its place of origin, and were agreeably impressed by its comfort and ease of handling. Both Blackburne engine and Sturmey three-speed gear box were familiar to us, and the performance of the machine was such as might be expected from any well built mount embodying these components. Our test was undertaken rather with a view to observing the action of the lubrication system and testing the spring-suspension, and other qualities which go to make a machine "rideable" or otherwise. The front forks appear to be exceptionally good, no clashing being noticed, while the ease of steering, with sidecar, was all that could be desired, as there was not the least evidence of side drag. Saddle comfort was assured, even when as a further test the machine was driven into broken ground at the side of the roads, and tried over the drainage gulleys cut through the turf.

On later models, a specially-made Brooks saddle will permit a slightly lower riding position, but this, perhaps, is not so important on a sidecar machine as on a solo mount.

A point worthy of note is that both brakes of the inverted V type work upon the back wheel where a special drum is provided. The foot brake is operated by pedal on the right footrest, while the hand brake, which is pivoted from the seat stays, is controlled from the right handle grip by means of Bowden mechanism; this hand brake is particularly effective when the machine is tending to run backwards (as when starting on a hill), and it, therefore, removes an objection often levelled against machines equipped with foot brakes on the right-hand (or kick-starter) side.

Special spring forks, with specially strong head and spring suspension of saddle and carrier, are features of the 4 h.p. Sheffield-Henderson outfit.

MOTOR CYCLES IN NIGERIA.

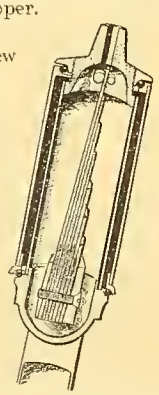
THE Comptroller of Customs at Lagos, Nigeria—Mr. T. F. Burrows—acts also as trade correspondent to the Department of Overseas Trade, and has contributed information as to the possibilities of the motor cycle in that country.

Excluding British Cameroons, Nigeria has an area of 336,000 square miles and a population of over 16,000,000, which is larger than the Dominion of Canada and Union of South Africa put together. There are many thousands of miles of roads suited to the use of motor cycles and sidecars, and very many more thousands of miles of pathways suited to the use of solo mounts. Internal communications are being continually added to, and work of this kind will continue for years. There are in use now probably less than 1,000 motor cycles, although the potential market there is said to be exceptional.

Mr. Burrows states that the cost of establishment, in Lagos especially, and to less marked degree in all the principal trading centres in Nigeria, is increasing. He has no doubt that firms will find it advantageous to open a large and well-equipped first-class branch of their business in Lagos, with a view of extension to the thickly populated trading centres such as Abeokuta, Ibadan, Zaria, Kano, etc., in the immediate future. They could not have better prospects of an extensive business than are held out to them in this country, if men of the right stamp are selected as representatives, who possess not only capacity for organisation, business ability, and expert knowledge of the line in which they are dealing, but the moral character requisite in a country of this kind.

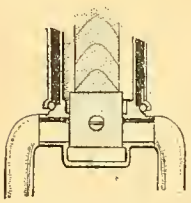
DdepartingFrom Convention.

Two Remarkable Motor Cycles in which Accepted Practice has been Ignored.



It is often said that the modern motor cycle is the development of the pedal cycle, and that were it a "designed" instead of an evolved proposition, the result would be entirely different from present-day practice. On this and the following page we describe and illustrate two machines quite contrary to conventional design.

The Peters Design.



THAT it is possible to produce a machine incorporating all the essential units which constitute a motor cycle and yet to reduce the number of building operations is exemplified in the first of the two machines under review, which is the production of Mr. J. A. Peters, 28, Victoria Street, London, S.W.1.

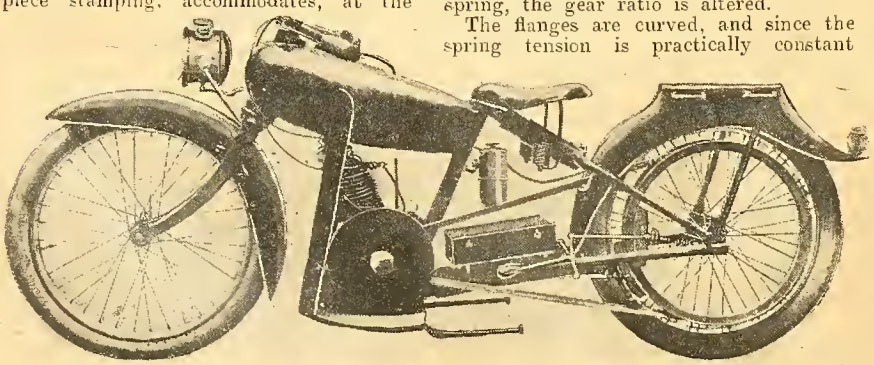
Mr. Peters, who has for many years been associated with the motor cycle industry, and has had experience as an aircraft designer, has, in many cases, based his design on aeroplane practice.

As may be seen from the illustration, the general appearance is somewhat unconventional, which is perhaps due to the absence of a frame proper.

Right: Side sectional view of the steering head.

Above: Pivot of front forks.

The two-stroke engine is inclined at 20° from the vertical, and is held at the head by lugs welded to the petrol tank, whilst the crank case plates are held by a bolt passing through the lower end of the vertical member welded to the rear of the tank.



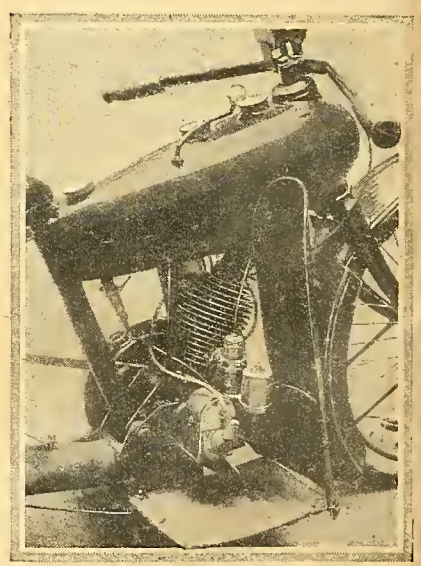
It will be noted that the construction is such that the engine forms one side of a triangle. The tank, which is a one piece stamping, accommodates, at the front, the particularly robust steering head.

A novel and interesting lubrication system is used, in which the oil is fed under pressure from the exhaust gases. A pipe from the exhaust port is connected to the top of the oil tank, and the resultant pressure forces the lubricant up a semi-syphon pipe through an adjustable needle valve into the delivery lead which lubricates the cylinder walls. The lubricator is within easy reach of the rider and constantly under observation.

Simplicity in Gearing.

A variable pulley gear is incorporated, and adopts the reverse principle to that most frequently used. The sprung rear wheel is linked to the front part of the machine by two members—one, incorporating the coil springing system, fixed to the rear end of the tank, and the other connected through links to the lateral bolt holding the crank case. The links attached to the lower member are extended, and are provided with a segment operated by a worm on the controlling lever protruding through the tank. The "coffee mill" action of turning the handle moves the rear wheel backwards or forwards, and, since the pulley is equipped with a floating flange held in position by a coil spring, the gear ratio is altered.

The flanges are curved, and since the spring tension is practically constant throughout its range of movement, it is obvious that the lower the gear employed the greater is the belt tension.



Peters motor cycle, in which the tank, engine, and one stay make a triangle to form the "frame."

Silencing through Frame Tubes.

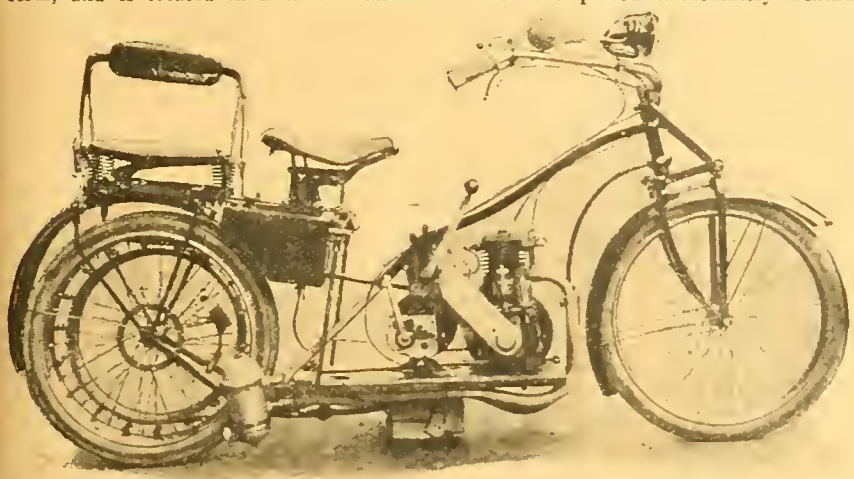
A point worthy of note is the arrangement of the silencer. The lower rear member, a stamping, receives the exhaust gases, which pass out through the fork tubes.

The rear springing system provides a snubbing action both ways, and consists of neatly enclosed coil springs located beneath the saddle and incorporated on the top rear member. The lower member

How the engine is fixed to the tank and the one tube in the construction of the "frame."

is, of course, hinged about the axis of the gear links. The front fork is ingeniously arranged and consists of a short laminated spring contained in the head.

A spring stand is provided, and is fixed beneath the footboards with which a pair of leg shields are made integral. These and the large domed mudguards should protect the rider from the mud. Number plates are incorporated in the rear mudguard, whilst the carrier is also a part of the same stamping. The riding position is low, and the weight of the machine is only 140 lb. ready for the road.



Kelly's Patent Motor Cycle.

As may be seen from the illustration, the appearance of the Kelly machine is most unconventional, whilst the spring-

Departing from Convention.—

ing system isolates the engine unit, gear box, saddle and carrier from the two wheels. A long laminated spring is anchored at the front of the engine platform, and is located in a slide immediately beneath the rear of the footboard.

A 3 h.p. Dalm two-stroke engine unit is used, and is mounted on plates fixed at the front end of the platform; whilst a three-speed gear box, clutch, and kick-starter are placed immediately behind,

Kelly's patent motor cycle, in which symmetry has been the last consideration. Mechanically, there appear to be many doubtful points, including the front forks and the flimsy construction of the rear wheel member.

and retained in position by four long bolts held to the top flat steel member. This latter material is used throughout, and another feature, which will be recognised as an unusual procedure, is the fitting of a twin-tyred wheel at the rear.

Sprung Tank and Carrier.

The tank is located beneath the saddle, which with the rear carrier is sprung on leaf springs. The front fork is of unusual design. Two laminated springs are anchored to a cross member at the bottom of the head and attached at their lower ends to the front axle. Two other members, which go to complete the triangles supporting the front wheel, are rigid. This construction limits to a great extent the action of the springs; this is probably advisable, as it may be noted that there is little clearance between the front mudguard and the exhaust pipe. We tried this machine, but since the gear box mounting, which is of a temporary nature, would not permit the gear remaining in mesh, our trial was of short duration.

We are informed that the machine will shortly be offered to the public by Messrs. Kelly Patent Cycles, Lion Motor Works, Black Lion Street, Brighton, but we recommend that, before doing so, they considerably clean up the design and subject it to very searching tests.

A Divided Wheel Spindle.

Tyre Repairs facilitated by a Divided Axle with Patented Locking Action.

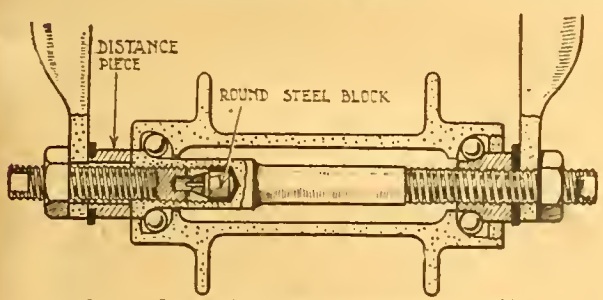


Fig. 1.—Gascoign's divided locking spindle assembly.

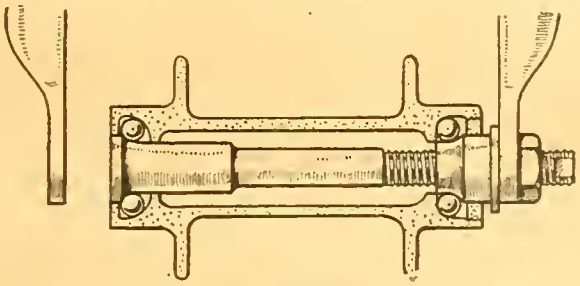

Fig. 2.—Divided axle with detachable parts removed

THERE can be no two opinions as to the desirability of being able to remove the tyre, tube, or cover from a motor cycle without having to interfere with the transmission and brakes.

This can be effected by means of a quickly detachable wheel, or it can be done even without taking out the wheel by fitting a divided axle. The difficulty in the latter case is to construct an axle which shall be absolutely firm and rigid when locked.

Distortion Avoided.

It has sometimes been found that when the parts are simply screwed together a slight amount of distortion occurs with detrimental results to the ball bearings and the free running of the wheel.

In J. Gascoign's patent (No. 143158/19) this difficulty has been got over in a very simple and efficient manner. One ball race is formed on an enlargement of the axle and at this end a hole is drilled and threaded. Into this is screwed the detachable part of the spindle after being first passed through the fork end and a distance piece, which can, in the case of a chain-driven machine, form part of the chain adjuster. This detachable portion has a hole drilled in the end, which is then divided into four by two saw cuts at right angles, and the hole is coned or bevelled to an angle which has been found to give the best results for locking and for easy release when required.

Inside the main part of the spindle is a steel block which spreads the coned end of the detachable part and effectively locks the threads together without any distortion. The movable cone on the other end of the spindle has a peg projecting from it to prevent it from rotating, and adjustment of the ball bearings is carried out by turning the axle itself (instead of the cone), which has a squared end for this purpose.

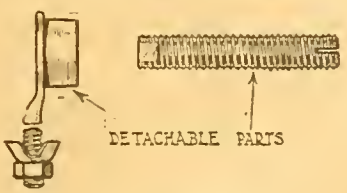

Fig. 3.—Removable parts of Gascoign's axle.

Adjustment of Bearings.

Turning the axle outwards tightens the bearing, while turning it inwards naturally has the reverse effect. When screwed home and properly adjusted, both sides are locked with the usual nuts. It will, of course, be obvious that the bearings need not be disturbed when the removable part is taken off to allow of a tyre to be changed.

It is not claimed that there is any novelty in a divided axle, but the patent covers the method of locking the several pieces firmly together. It is proposed to manufacture the complete axle to fit all standard patterns so that all a rider need do is to remove his solid axle and fit the new one in its place, which is a matter of minutes only. Production will start in Coventry in the near future.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

TO "EXETER" COMPETITORS.

Sir,—I am anxious to get in touch with the driver of a Triumph and sidecar who let me have some petrol near Honiton on the recent London-Exeter run.

If you can assist me in tracing this gentleman I should be very grateful. H. F. OWEN EVANS.

TWOPENCE PER MILE INCLUSIVE.

Sir,—Mr. E. Parsons has overlooked the fairly large item of "depreciation" in his calculation of running costs. This is at least 20% per annum on the capital cost, which would add one penny or three halfpence to the cost per mile.

Ryton-on-Tyne. T.A.C.

"IXION'S" LIKENESS.

Sir,—Your correspondent, Mr. A. Arnold, in *The Motor Cycle* for January 13th, puts forward a request for you to publish a photograph of the famous "Ixion." I really hope you will do nothing of the sort. At present "Ixion" is a mysterious being whom we all admire, and if you publish his photograph he may lose most of his charm. You will bring him down to the level of an ordinary human being from his present high seat among the gods.

PERCY J. FOSTER.

THE LURE OF SPEED.

Sir,—After having for many years ridden American motor cycles, I have now a British-made twin of 8 h.p. This machine is of quite reliable make, and well tuned, but I cannot get from it anything like the speed I enjoyed with my others. In each case the engine capacities have been the same, yet my present mount is nearly 10 m.p.h. slower than my former machines. Why is this? I have pondered a good deal over it. Perhaps your readers can offer some solution.

Gillingham. HANLINDEX.

THE SUPER-SIDECAR AND THE INFRA-DRIVING SEAT.

Sir,—Drivers of sidecars agree that designers are paying too much attention to sidecars and not nearly enough to the driving machine. In the many recently published illustrations of over-elaborate sidecars one readily contrasts these with the antiquated pedal bicycle type saddle, cumbersome tank, and lack of mudguarding provided for the man who does the work.

Why not an open frame with mudguarding as on the Unibus, with a bucket seat as on the Reynolds runabout?

Look at the illustration of the latter. Imagine, say, an 8 h.p. J.A.P. engine, three-speed gear, and 3in. tyres, and one then feels that one would not object to facing the elements as driver, however elaborate the coupé sidecar in which the passenger lounged. REGINALD BOASE.

WHAT "IXION" RODE.

Sir,—There seems to be a general impression among motor cyclists that the 4¼ h.p. B.S.A. is an unusually heavy machine, and I fear that "Ixion's" notes on his 1920 machines in a recent issue will tend to strengthen that erroneous impression. He says of the "B.S.A.," "Her weight renders her a little lumpish to handle till she begins to move," whereas he does not refer to the weight of his Norton, or of his Scott, or A.B.C., in spite of the fact that it is quite likely that the B.S.A. was actually the lightest of the quartette.

In last year's Six Days, the lightest 4¼ h.p. B.S.A. weighed 280 lb., as did the lightest Scott, while the lightest examples of the 3½ h.p. Norton and the A.B.C. each weighed 7 lb. more, or 287 lb. These weights of course include all kit, as well as petrol and oil, so that the weights of individual machines of the same type may vary according to the rider's idea of the amount of kit necessary. It is the lightest machine of each type, therefore, which must be taken as the basis of comparison.

I may add that my own 1920 4¼ h.p. B.S.A. complete with Lucas Magdyno set, large leg shields, all tools and kit, and with full tanks, weighs just under 290 lb.

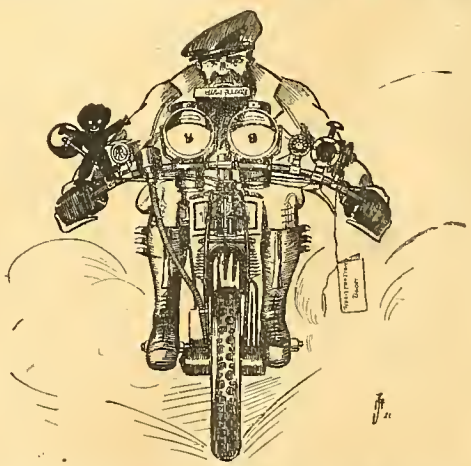
Comment appears superfluous, except to say that, in addition to praising the power and reliability of his B.S.A., "Ixion" should have referred affectionately to its unusually low weight for a machine of its class.

D. S. HEATHER, B.Sc., A.M.I.A.E.

THE 1921 T.T. RACES.

Sir,—With reference to Mr. A. L. Judge's letter in *The Motor Cycle* of January 13th, may I express the views of an amateur?

I do not deem it at all unsportsmanlike to enter six machines of the same make. If Mr. Judge has a 'bus which he thinks will do good in the race, why not race it against six of the same make? The said six machines will undoubtedly be all very much the same. It is then quite plain that if he can beat one he ought to be able to beat the six. My motto is more the merrier. OUTSIDER.



Birmingham.

FEBRUARY 1ST!

Sir,—I crave your indulgence for the space of time required to scan the enclosed.

I am aware that you do not habitually waste space on this sort of rot, but I have often enjoyed the exceptions.

I am compelled to forward this under the baneful eyes of several companions, so if you have no use for it, be as nice as possible under the circumstances. W. H. WILCOCK.

There are riders whose great delight it is to fill up the handlebar of their machines with various accessories. The new licence holder will be a delight to them instead of a nightmare, as it is to the unfortunate gentleman in the sketch. (See letter by Mr. W. H. Wilcock.)

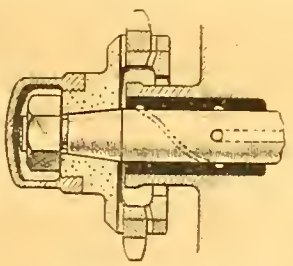
WAKE UP, ENGLAND!—ONE VIEWPOINT.

Sir,—While British motor cycle manufacturers are worrying their dear little brains *re* spring frames, but still use rim brakes and drip feed lubrication on their 1921 bargains at £250 or more, I am enjoying myself with the perfect running of a Harley-Davidson, and also availing myself of the excellent "service" to be had from the H.-D. Co. in London. It is the same old saying, "Wake up, England."

Nuff said. EX-R.A.F.

Weymouth.

DO WE COUNT?



Sir,—I have just obtained from the Post Office a copy of Form R.F.1, and on filling it up I notice that in the space numbered B.2, the engine number of the motor cycle is not asked for as is the case for motor cars under B.1. We have been led to believe that the new regulations would be a check on the stealing of motor vehicles, and if this is the intention, is it not highly necessary that the engine number and frame number of the motor cycle should be entered in the registration book, as is done in the case of a car? Perhaps we motor cyclists are not of sufficient importance to be protected in the same way as car owners.

In my own particular case, although I have not seen a copy of the new registration book, I shall do my utmost to persuade the licensing authorities to enter in my book, the number of my engine and frame number, and would suggest that all other motor cyclists should do the same and quote these additional particulars on their application form when applying for a new licence. B. W. BURROW.

LUBRICATION OF CHAINS—AN IDEA.

Sir,—Having seen the question of chain lubrication mentioned several times lately in *The Motor Cycle*, it struck me that you might be interested in a method I have used on my machine with great success.

The rough sketch enclosed gives a sectional view of the sprocket wheel which is mounted on a boss, which in turn is keyed to the crankshaft. The engine is lubricated with an oil feed to the main shaft bearing in a similar manner to the A.J.S. Any surplus oil which works out of the bearing is flung into the recess shown in the sprocket boss, and centrifugal force carries the oil through the holes and channels shown right on to the roller and rivets of the chain. Only a very small amount of oil really comes out of the bearing, but it is quite sufficient to keep the chain always perfectly clean and thoroughly lubricated inside the rollers.

An excellent idea for oiling a chain sprocket, and thus the chain. (See letter from D.E.J.)

The arrangement may, of course, have been in use for some time, but it is quite original in my case, and was carried out at the beginning of last year, since when it has done 4,000 miles. My machine is a 3½ h.p. Rudge with the original machine very much altered, particularly the engine.

I find plain bearings to the engine shaft much sweeter running, and, judging by this year's running, far more durable than ball bearings. They are, of course, fitted very accurately and properly lubricated, and I am of the opinion that ball bearings are only fitted because they are cheaper. My engine will revolve just as freely now as it did with the ball bearings, and one has only to see what the A.J.S., Indian, and Blackburnes have done in order to see that a plain bearing properly designed is quite satisfactory.

Glasgow. D.E.J.

LIGHT HEAVYWEIGHTS.

Sir,—May I humbly suggest that the wording of the following extract from the interesting article on "The Sporting Solo Mount" in a recent issue is just a little misleading, viz.: ". . . the T.T. Rudge-Multi, although of fairly heavy build, is essentially a sportsman's mount. . ."?

True enough, it is difficult to realise, when looking at the I.O.M. Rudge-Multi, with its large tank, voiturette wheels, and generally "hefty" appearance, that it only weighs 188 lb. unladen. This figure I get from the excellent "Buyer's Guide" included in your last Spring Number. Surely "sturdy" would have been a better word than "heavy."

Moreover, I find that, of all the models mentioned in your recent article, which were also to be found in the "Buyer's Guide," the Rudge is without exception the lightest. No doubt it would surprise most of your readers to find that, according to the specifications I refer to, the T.T. Rudge is just as truly a lightweight as the 2¾ h.p. Douglas.

May I conclude by emphasising what a thorough blessing it is to have a really useful size of tank; to be able to pour in a two-gallon tin without "squeezing," and forget about it for 200 odd miles—in my case a fortnight's daily running to Town and back. Why is the Rudge almost alone in this?

East Sheen, S.W. APPRECIATIVE.

THERE ARE STILL MOTOR TRICYCLES.

Sir,—I shall feel much obliged if you will kindly give publicity to what I consider to be a great injustice to users of tricycles of lightweight under the new motor taxation.

Whoever drafted the Act must have forgotten that there are still such things as three-wheeled *cycles* proper (as distinguished from tricars and runabouts) still in use. These being light in weight, of low power, carrying one person only at quite a moderate speed, should surely not be liable to the same taxation as a 10 h.p. runabout for three or four passengers? Take, for instance, a light *pedal* tricycle fitted with a 1½ h.p. motor attachment, doing no damage to the road surface, not doing more than 15 m.p.h., and weighing in all under 100 lb. Can anyone say that such a machine is fairly taxed when its owner has to pay *double and more* than the owners of a motor cycle weighing up to 200 lb. with a 3½ h.p. engine, and which can carry at a speed of anything up to 60 m.p.h. two or even more persons? DISGUSTED.

Keynsham.

ELECTRIC LIGHTING CABLES.

Sir,—I sincerely hope that "Ixion" has recovered from his headache. It is too bad that he should be inflicted with technical details that are of little value to the average motor cyclist. Lighting cables suitably fixed to the machine are subject to little or no strain, or bending movement; therefore, what is the use of specifying tests that could only be conveniently carried out with a steam-roller? The use of special and expensive material is often put forward by theorists, who do very little, if any, riding, and follow the sport mostly on paper, with the result that motorists who are anxious to fit electric lighting sets get the impression (wrongly) that it is an expensive and difficult matter.

My only set has been in use nearly two winters, and cost just over £3, the cable used being ordinary round twin workshop flexible with a compound finish. The wires are just twisted together (groans from the theorists), there is no elaborate terminal board such as described in a recent number of *The Motor Cycle*, and what is more important, no-trouble.

F. BRADFORD.

ARE MOTOR CYCLISTS FICKLE?

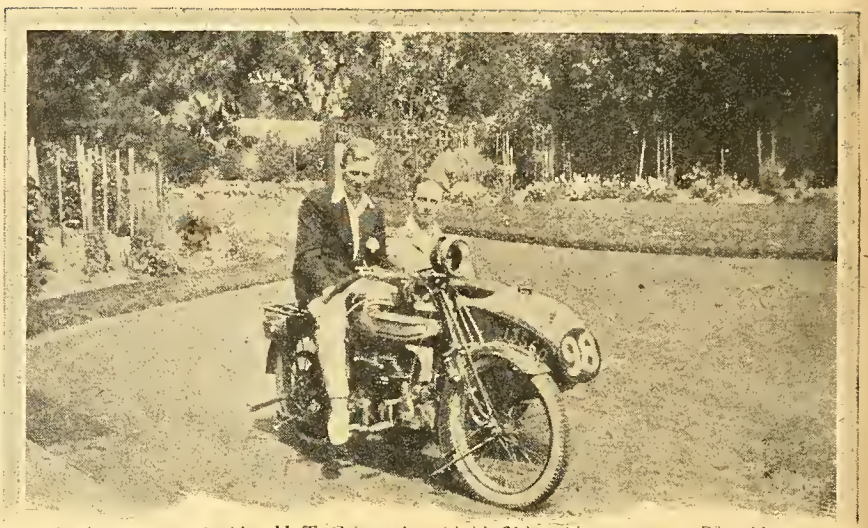
Sir,—I have read "Crimson Rambler's" letter "Are Motor Cyclists Fickle?" with interest. I have often wondered if I am a freak in this respect. My fickleness does not only extend to the fair sex but also to my favourite hobby, motor cycling. At the same time, I do not think my case is a rare one. I have met others of the "fickle ilk." Analysing the question, I should imagine that the majority of sporting riders are fickle, given the necessary cash.

I seldom see a new and resplendent sporting mount without coveting it, and go through hours of torture wondering if I can run to it. It must not be imagined that I soon tire of a 'bus if it is a good one. I would keep *all* the good ones if I could and buy the new one in addition. At present I covet the Brough Superior, as I have seen it at rest and at work, and "some" work at that, and I won't be happy till I get it!

Now how does the following list show the fickleness of just a sporting amateur? In four years I have owned the following: Two T.T. Rudge-Multis, one Isle of Man Rudge-Multi, one 3½ h.p. Zenith Green, one 4 h.p. Rex (Speed King), one 3½ h.p. Brough, one 2¾ h.p. Humber, one 3½ h.p. T.T. Norton, one 2½ h.p. Sparkbrook, one 2¾ b.p. o.h.v. N.U.T., and two 6 h.p. sporting Zeniths.

My life is spent in a medley of satisfaction of possession and dissatisfaction of desire for something new—and yet I love each. A. W. GRAHAM MARTIN.

REAR SPRINGING.



Sir,—I have to thank "Ubique" for his somewhat adverse criticisms, under the above heading in *The Motor Cycle* of January 6th, of my system, and would, in its defence, ask him some questions. He is greatly disappointed, as he thought we had really got a system retaining constant transmission tension. Well, can he state that my system fails in this respect? When did I mention eccentric motion? I am afraid this is an eccentric idea of "Ubique." Why an opinion should be formed that my system strongly followed car lines I cannot say. In a letter written to *The Motor Cycle* in August, 1920, I distinctly mentioned the locomotive or Stephenson.

It is not whether the device would look better with coil springs, but whether it works better, that I am concerned. I use cantilever (not quarter-elliptical) springs, and thereby follow best car practice, because cantilever springs give the best result, and are necessary if one is to maintain the centre of the fulcrum coincident (not eccentric) with the centre of transmission system.

Regarding the question of simplicity of wheel removal, I would say that, in the design as published, there are three extra (not six) operations to be performed, but that these altogether occupy about one minute. It should be perfectly obvious that any motor cycle using knock-out spindles can still do so if using my spring system, and therefore these three operations would be unnecessary.

There is no difficulty in providing protection from mud, grit, etc., for the radial blocks, so that clogging would not result. "Ubique" must understand that there are other methods of preventing lateral movement than by naked flanges, although it is not possible to show or describe every method in a small general drawing.

G. HAROLD DURSTON.

An Australian trials rider, H. T. Grimwade, with his 3½ h.p. Norton outfit. The sidecar is a spring wheel Goulding, manufactured locally.

"AIR SPRINGING" EXPERIENCES.

Sir,—I am interested to note that your correspondent "R.N." mentions the old A.S.L. motor cycle made by Air Springs, Ltd., with their old spring frame.

It may be of general interest for you to know that I still run a 1912 model A.S.L. fitted with 22in. wheels. The machine was put away in 1914 until 1920 for obvious reasons, but, on being "recommissioned," it has given every satisfaction.

I have had several excellent trips during the last two years, out in all weathers every day, and spending ten days in North Wales in the summer, with no mechanical trouble. I have fitted a modern coach-built sidecar and a last year's Burman gear box, and have yet to find a hill to stop us with two up and luggage. This certainly speaks very well for the A.S.L., and I am sorry to learn that this firm is not now in existence. In fact, the machine runs so well that I am contemplating fitting 26in. wheels. It is quite common for us to pass many modern outfits on hills.

Unfortunately, the present-day roads are too much for the "air springs." The really fearful pot-holes burst the pneumatic sleeve, and I have now fitted large metal coil springs over the air chambers, which work satisfactorily, although not giving such a delightful resiliency as the "air spring."

I should welcome the experiences of any other A.S.L. riders, if there are any left.

EX R.N.

Derby.

GRADIENT METERS.

Sir,—We should like to refer to "Ixion's" "Comments" in your issue of January 13th, on the behaviour of one of our gradient meters, which he succeeded in fixing to the accessory cross-bar of a motor cycle. We do not quite know how he managed the fixing, and we quite agree that the standard brackets as supplied for motor car instrument boards do not lend themselves very readily to fixing on a tube.

With regard to "Ixion's" suggestions, which we appreciate, we are considering a suitable, universal, fixing clip for motor cycles, and we also make the instrument with a dial reading up grades only, to 1 in 2½.

We are afraid there is no hope of an instrument for measuring gradients ever being entirely immune from the effects of acceleration and retardation, but with reasonably steady driving the results given on a motor cycle will be very nearly accurate.

There are roads on which the surface is so bad, as "Ixion" says, that the needle cannot help oscillating, and we certainly do not claim to be able to measure accurately the slope of the side of a pot-hole at 30 m.p.h.

TAPLEY AND CO. (W. Tapley).

THREEPENCE PER MILE—INCLUSIVE.

Sir,—The following details of running expenses kept carefully for twelve months of a January, 1920, 4 h.p. Triumph and sidecar may be of interest. Decarbonising and trifling repairs have been done by myself; the rest at a garage. The only defects in 7,000 miles in all weathers, half the mileage in Cornwall, the rest throughout England and Wales, north, east, and west, have been a frequent breaking of wheel ball races aud of sidecar mudguard.

Mileage.—7,100.

Chains (Renold).—One, 2,500 miles only; second, still running.

Tyres.—One halfpenny per mile, including belt cost.

Belts.—Dunlop 1in., 5,500 miles; John Bull 1in., still running.

Petrol.—About 60 m.p.g. averaging the year. National benzole produces 10 m.p.g. more than No. 1 spirit, when it can be got, which is not often.

Oil.—1,650 m.p.g.

Total Running Costs (chiefly in hilly country with two up), including all repairs, insurance, etc., 2¼d. per mile. Including depreciation of one-tenth cost and 5% on capital = 3d. per mile.

This is the total cost in all weathers for very hard usage in bad country. For lighting I use a converted set of carbide lamps (no more carbide after the first thousand miles for me), with 12 c.p. head light and two screw-in bulbs for rear and side, and 60 amp. 6 volt accumulator in a box let in the sidecar bottom under the seat, the whole set converted and wired up with three separate switches at trifling cost, and found perfectly reliable and cheap.

Wanted.—(1.) Control wires that do not stick and rust after a week's rain, and no plating on the cycle.

(2.) Mudguarding that is rider-guarding.

(3.) Magneto rocker arms that do not stick in persistently wet weather.

The A.A. has, in the year, saved me £4, supplied me with much valuable information, and prevented me having to sleep one night under the hedge.

Lastly, an appeal. Will some firm arrange to supply benzole in Cornwall?

CORNISH PARSON.

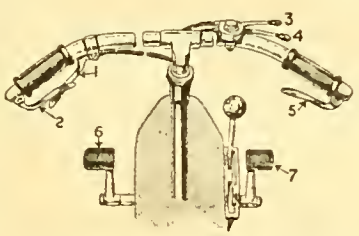
Redruth.

WET WEATHER RIDING IN DRESS SHOES!

Sir,—Concerning the letter of Mr. J. Thornton in your issue of the 13th inst., in which he remarks upon mudguarding, may I make a few remarks in appreciation of my A.J.S. in this respect?

The machine is a 1920 model, and while I do not consider the protection perfect, it is certainly very good. After supplementing the generous front guard with a pair of Sterling mudshields, I have discarded overalls entirely. I recently rode twelve miles in pouring rain to a dance in dress shoes, and arrived quite spotless. Incidentally, the shields kept my feet quite warm.

My only criticism is that at speeds in excess of about 17-20 m.p.h. the rear wheel flings liquid mud on to one's back and along the off sidecar panel. However, so long as one rides at about 15-17 m.p.h. it is possible to remain perfectly clean—in fact, it is the finest machine I have ridden in this respect. I have never had the pleasure of riding either a Scott or an A.B.C., both of which appear to provide almost perfect weatherproofing.



Birmingham. A PERFECTLY SATISFIED USER.

CONTROLS—AN IDEAL.

Sir,—With reference to the standardisation of controls as recommended by the A.C.U., I shall be glad if you would give me an opportunity of expressing my views, as an old reader of your esteemed paper.

The aim of standardisation of controls is to give the rider in any circumstances thorough mastery of his machine. It is therefore unnecessary to make the action of the controls instantaneous and simultaneous. The recommendations put forward by the A.C.U. hardly seem to meet the needs of motor cyclists. For example:

(1.) Starting the motor cycle. *(a)* The engine working, the rider is on the left side of the motor cycle. He rests on the left foot, raises the right, and is able to act freely on the pedal 7 to put the clutch in. *(b)* The machine and engine being at rest and the pedal 7 being at its lowest point, the rider on the left side of the machine presses upon the valve lifter (1), and the right hand being free pushes the machine forward. The engine having been started, a slight pressure on the clutch lever 2 causes the machine to stop without any further movement of the hand.

On this system of control suggested in the letter of M. Viratelle, 1 is the valve lifter, 2 clutch lever, 3 air, 4 throttle, 5 front brake, 6 rear brake pedal, and 7 the clutch pedal.

(2.) While running. The gear and carburetter controls are grouped on the right-hand side of the handle-bar. As a rule, riders are right-handed, consequently acting with greater precision with the right than with the left, so that it is necessary that the right hand should control the two levers mentioned above, which require greater sensitiveness than brake or clutch control. By referring to the diagram, it will be at once seen that it is possible simultaneously to close the throttle, lift the valve lifter, and put the clutch out; or put the clutch out, change speed, and put the clutch in, etc.

(3.) To stop. The instinctive movement of the rider who desires to stop quickly is to close his hands on the levers on the handle-bar and drop his feet to the ground. In the particular case to which the diagram refers, this instinctive movement acts upon the clutch lever 2 and the brake lever 5.

(4.) Skidding. When on greasy or slippery roads, in order not to slip or skid, the rider only lets the clutch in slightly, and in the case which I am showing by means of the diagram this is done by a simultaneous gentle pressure on the levers 2 and 7—that is, the clutch controls.

(5.) Both brakes may be applied simultaneously.

These examples give but an imperfect idea of the benefits to be derived by this arrangement of the controls. There are many other circumstances easily imagined by riders in which sensitive controls ensuring instantaneous and simultaneous action must prove of great benefit.

M. VIRATELLE.

A LICENSING MISAPPREHENSION.

Sir,—When will the Ministry of Transport really and finally find out what they want us to do?

I paid 7s. 6d. for a pretty nickel-plated licence card holder, and fitted it with six wood screws to the centre of the door of my sidecar, a sufficiently conspicuous place, surely. Now I see by the daily press that the holder must be not less than 2ft. 6in. from the ground, whereas, in its present place, mine is only 2ft.

Now I suppose I must buy another holder, or fake up a clip to attach the present one to the motor cycle, since my sidecar is too low built to allow of the holder being fitted 2ft. 6in. from the ground. Also, unless I choose to run about with six wood screw holes disfiguring the beautiful paint on my sidecar door, I must have the holes plugged, and the door repainted. Who is going to compensate me for all this humbug and expense?

I suppose the next thing will be that we shall be required to have the holder facing both sides and back and front, and all illuminated at night! ELDON.

Reading.

[Our correspondent has evidently found a "mare's nest" in "the daily press"; for the regulations setting maximum and minimum heights for licence-holders only apply to motor cars.—ED.]

SUMMARY OF CORRESPONDENCE.

Lt. G. Hazel, R.N., replying to a correspondent in a recent issue who signed himself "Ubique," writes in defence of the Durston system of rear springing. He claims that he invented a very similar system himself, and has severely tested the device on his own machine with very satisfactory results despite the severest weather conditions. [We must make it clear here that the "Ubique" of this correspondence is *not* the "Ubique" of *The Motor Cycle* staff.—ED.]

With reference to correspondence under the heading of "A Tall Order," Mr. E. Griffiths takes exception to an earlier letter by "J.S.J.," in which the latter stated that his two-speed Velocette would climb *any* hill. Mr. Griffiths has found a gradient (Mow Cop) which has proved too much for his own two-speed Velocette, although he states that he has been unable to persuade several other machines up this hill, including an 8 h.p. sidecar outfit. Previously, he had owned five different years' models A.J.S. machines, "and they always managed to climb Mow Cop with ample reserve power."

"Conn Rod" last week commented on the "unsightly" effect of a licence holder on either the handle-bar or number-plate. Millfords Ltd., of Birmingham, write calling attention to their M.A.P. combined number-plate and licence holder, and also to the M.A.P. model B holder that is designed to fit on the spring fork spindle or to the butterfly nut on the head lamp.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3

"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C., or of leading Booksellers and Railway Bookstalls.

CLUB NEWS.

A Motor Cycle Club for Accrington.

It is proposed to form a motor cycle club in Accrington, and a meeting with this object in view has been arranged to be held at Palmer's Café, Whalley Road, this evening (the 27th), at 8.15. All interested are invited to attend this meeting.

Lancaster, Morecambe and District M.C.C.

The first annual meeting of the Lancaster, Morecambe, and District Motor Cycling Club was held at the County Hotel, Lancaster, on January 17th. Mr. F. Sharpe was elected as president, Mr. Gordon Reid captain, Mr. W. Atkinson vice-captain, Mr. R. L. Ducksbury secretary, and Mr. J. Garlick treasurer. It was decided to affiliate with the A.C.U.

Halifax M.C.C.

Members of the Halifax M.C.C. mustered in force at the Boar's Head Hotel on the occasion of the annual dinner on January 13th. Through the generosity of one of the club patrons (Mr. H. Somerville), a splendid concert party attended and kept the company in a lively humour for the whole of the evening. Owing to the absence of four of the principal prize winners it was not possible to present the prizes won last year. This year their programme will be exceptionally strong, including, provisionally, four trials and two hill-climbs.

North-Western Centre A.C.U.

At a meeting at Stockport on January 15th the following officials were elected for 1921: Chairman, Mr. H. Reed (Manchester); vice-chairmen, Messrs. H. Marsden (Stockport) and V. Horsman (Liverpool); hon. treasurer, Mr. A. Taylor (Burnley); hon. secretary, Mr. J. H. Place (Burnley); hon. auditor, Mr. G. E. Watts (Stalybridge); and representative to A.C.U. General Committee, Mr. H. Reed (Manchester). It was decided to allocate the three open permits as follows: One to be used by the Centre as a speed trial, a second to be given to Liverpool for a reliability trial, and a third to Stockport for a hill-climb.

Heaton Moor M.C.C.

A club has been recently formed which will be known as the Heaton Moor M.C.C. Its objects will be to run one-day reliability trials, hill-climbs on time and formula, speed trials, and social events. The hon. secretary is Mr. W. Williamson, 1, Brownsville Road, Heaton Chapel.

North Lindsey A.C.

The annual general meeting of this club was held at the Crosby Hotel on the 12th inst. Since the 1920 season has left the club in a sound financial condition, the subscription has been reduced. A good programme has been arranged for 1921.

A resolution expressing motor cyclists' dissatisfaction with the new taxation scheme, and with regard to carrying an additional identification badge, was passed unanimously, and the secretary was instructed to forward this to the local M.P. The hon. secretary is Mr. F. W. Llewellyn, 9, Clayfield Road, Scunthorpe, Lincs.

South-East Durham M.C.

This club has just been formed with Trimdon, Wingate, and Wheatley Hill as centre. The headquarters are at the Comrades' Club, Ashleigh, Trimdon Station. At present there are seventy members, and it is hoped to have over a hundred before the opening run to Richmond on Good Friday. The club has in hand arrangements for a reliability trial of 120 miles on Easter Monday. Among the awards of this trial there will be three gold and three silver medals confined to club members.

North London M.C.C.

The annual general meeting was held on January 14th, at which Mr. A. J. F. Beaurain was elected vice-captain. The officers for the coming season, who were elected at the annual dinner, were confirmed in office, Mr. A. W. Day accepting the position of secretary.

Redditch and District M.C.C.

An extensive programme has been arranged for the coming season, some twenty events having been fixed, including reliability trials, gymkhana, speed events, etc. Five valuable cups are to be competed for by members of the club, including the B.S.A. and Terry challenge cups, which were put up last year in the West Midland open trial.

Motor cyclists wishing to join the club should send in their names immediately for the fixture list and entrance form to the hon. sec., P. C. English, Easemore Road, Redditch.

Taunton and District M.C. and L.C.C.

The Taunton and District Motor Cycling Club at its recent annual meeting decided to extend the sphere of the club so as to embrace light car owners, and the club in future will be known as the Taunton and District Motor Cycle and Light Car Club. Lieut.-Col. Dennis F. Boles, M.P., again accepted the presidency, Mr. Stewart Goodman, the former secretary, being elected captain, and Mr. S. L. Ward, the assistant secretary, being elected secretary.

Syndicated Propaganda.

What is Needed to Foster the Greater Use of British Motor Cycles Overseas.

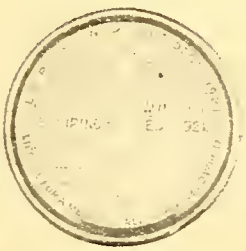
THE subject of joint representation touched upon recently by an Indian correspondent is one that should engage the attention of our manufacturers. Already there are indications of supply overtaking demand, and when that is more forcibly brought home, manufacturers will find the disadvantage of being late in the field and our American friends firmly established overseas. It must not be assumed too lightly, as some people appear to think, that a maker has only to send a competent representative abroad to ensure immediate success. Such is by no means the case, and most makers are fully alive to the facts. Riders who have lived abroad know full well the difficulty and delay in obtaining British spares and parts, and this fear has often driven customers to purchase machines emanating from another country. There is no need, however, to let this obstacle stand in the way of British enterprise, for it is only required that our makers should combine in self-defence.

Let, say, five of the leading manufacturers agree to act jointly in appointing a thoroughly competent man to act as their representative—not as an agent—in, say, Bombay for all India. He should be of unimpeachable integrity, of sound constitution, unmarried, and not over thirty-five years of age. His whole time should be given to his employers (the syndicate), and should be confined to selling, and issuing of propaganda; while his advice should be available at all times to riders of "syndicate" machines. He should, in fact, closely watch the interests of the firms forming his syndicate, and one of his most important tasks would be to organise a central spare parts depot.

It is imperative that more British motor cycles are sent overseas. At the present time the lack of direct representation in the various countries appears to be a stumbling block, and such concerted action as is suggested by our contributor would undoubtedly prove of great value to any group of makers who wish to gain a strong foothold in any of the Overseas Dominions.

The syndicate would supply him from time to time with literature recording successes for distribution in India, while the representative might contribute to *The Motor Cycle* a monthly letter of local topics, which most readers would appreciate especially if accompanied by illustrations. Each member of the syndicate would undoubtedly benefit by this method, as it secures to each a faithful service free from all partiality at a minimum cost of salary and establishment charges. At the same time, provision could be made in the article of agreement for a withdrawal of a member on suitable notice being given in favour of another manufacturer wishing to enter the field.

Further detail might be elaborated, but there is no need to do so here. If success is attained, and surely it would be, then South Africa and Australia and other dominions might be similarly treated to the benefit of all concerned.



LICENCE HOLDERS.

Too many Small Nuts and Bolts are used in the Majority of Holders.

Particulars of Some of the Exceptions.

Rudge.

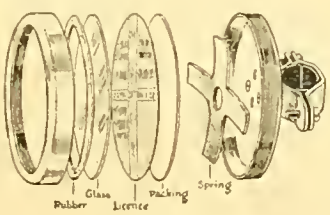
Wates.

Brandish.

Brown Bros

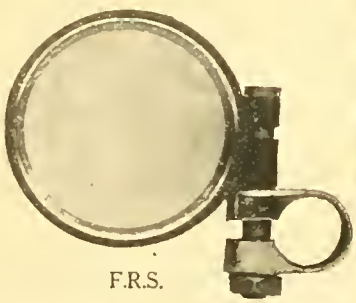
IN the course of the last month we have examined a large number of examples of licence card holders. One point which has struck us very forcibly is that their "designers" have not sufficiently taken into consideration the fact that motor cyclists generally clean their own machines, and that when an article has to be cleaned any projections not only hinder the process but tear the cleaning rag.

In too many cases the two important parts of the licence holder are secured by many tiny bolts and nuts, which are not only unsightly, but render the process of cleaning difficult and arduous. There is no doubt, however, that the nut and bolt fixing is secure, but, on the other hand, there is really no excuse for its existence, as there are other methods which are equally satisfactory. Quite a number of licence card holder manufacturers have avoided the use of these unsightly screws, some by clamping a grooved ring, which not only holds the glass, but also the back portion; others have made a screw fitting, while a third method is to use a split ring.

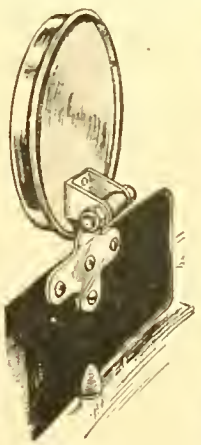


When Attached to the Number-plate.

Another point worthy of remark is that unless the brackets holding the number plate on to the mudguard are strong enough they are liable to break owing to the extra leverage caused by the superimposed holder.



The F.R.S. holder, made by the well-known lamp concern, is one of the neatest on the market, and contains one nut only, which not only serves to hold the device together, but is utilised also to secure it to the handle-bar. Brown Bros.' holder uses the spring ring system as used to secure lamp glasses, while H. Taylor and Co., Ltd., of Store Street, W.C., have introduced a neat holder with its outer rim split and secured by a single screw. The exterior is entirely smooth. Other neat holders are the Cowey and the Rudge-Whitworth, both of which have screw-on fronts, and, like the Taylor, the only nuts and bolts are in the clip fixing. Wates Bros., of 132, Charing Cross Road, have a holder which, like the F.R.S., has only one nut, and this on the clip. The Tredelect holder, too, reduces the number of bolts to a minimum.



An unusual licence holder which has no nuts and bolts at all. The W.A.G., made of transparant fabric.

Cowey.

Taylor

Continental Competitions for 1921.

EACH year the representatives of the various French motor cycle clubs draw up their programmes for the season, and submit their dates to the Union Motocycliste, which prepares a national calendar. For the present year there are twenty-one events on the programme, and although others may be decided on at a later date those already selected are the most important.

The most important event of the year is the Motor Cycle Grand Prix race, to be held at Le Mans on July 23rd. This corrresponds in importance to the T.T. race in the Isle of Man, but differs from it in being held on a very flat and fast road forming a ten and a half mile triangular course. This year it has been decided that motor cycles only shall be admitted, there being three classes of 250, 350, and 500 c.c. By selecting July 23rd as the date of the Motor Cycle Grand Prix, the big car Grand Prix date will have to be changed to Sunday, the 24th.

The Cycle Car Grand Prix has been fixed for September 17th, also on the triangular course at Le Mans. The event, it should be noted, is being organised by the national authority, the Union Motocycliste, although forming part of the three-day meeting being got up by the Automobile Club of the West of France.

As the Six Day Trials are not to be held in France this year, the Union Motocycliste has decided to hold a couple of touring competitions, probably in the neighbourhood of Paris, the first one being on April 24th and the second on July 26th. The details of these have not yet been decided on. The Paris-Nice trials will open the series of competitions on February 21st to 28th. Paris to Madrid does not yet figure on the programme, for official sanction has been withheld until the promoters have given definite guarantees.

Feb.	21-28.	—Paris-Nice Reliability Trials.
March	27-28.	—Marseilles-Nice and Return Reliability Trials.
April	3.	—Tavignano Cup, Corsica.
,,	10.	—Moto-Cycle Club of France Speed Tests.
,,	14-20.	—Nice Motor Cycle Week.
,,	24.	—U.M.F. Touring Competition.
May	15-16.	—Provence Circuit.
,,	15-16.	—Military Motor Cyclists' Competition.
June	26.	—Moto-Cycle Club of France Touring Competition.
July	10-14.	—Motor Cycle Meeting at Le Mans.
,,	23.	—French Motor Cycle Grand Prix Race at Le Mans.
,,	31.	—Mont Ventoux Rally and Hill-climb.
Aug.	14-15.	—Races on l'Enre Circuit.
,,	14.	—Dinard Rally.
,,	21.	—La Baule Rally.
Sept.	4.	—Mont Verdun, Lyons, Hill-climb.
,,	17	—French Cycle Car Grand Prix Race at Le Mans.
,,	25.	—Gaillon Hill-climb.
Oct.	2.	—Moto Cycle Club of France Kilometre Speed Trials.
,,	30.	—Gometz Hill-climb.

Taxation.

Have *you* obtained your licence yet?

The Cycle Car Definition.

The writer of the motor cycle column in *The Daily Mail* considers our suggested definition of 1,100 c.c. and 8 cwt. limits the best.

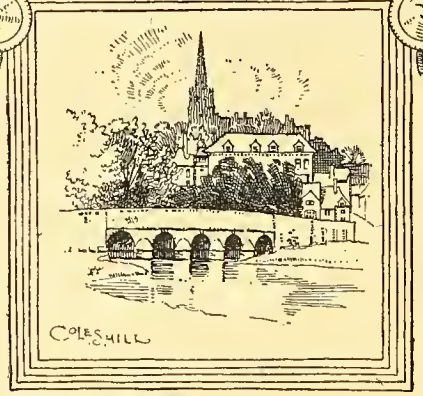
1920 Senior T.T. Winner.

T. C. de la Hay is now back again at the Sunbeam works, where he is in charge of the test department. In all probability last year's Senior T.T. winner will defend his title in the Isle of Man this year on the same machine.

The London-Exeter Run.

W. G. Churchill (2¾ Verus), whose award was held in abeyance because he did not sign out at Exeter, has been proved to have left the check to time, and has been awarded a gold medal. H. Gold (2¾ Olympic), who did not sign the sheet at Exeter, is granted a silver medal.

A.C.U. Secretary in the North.



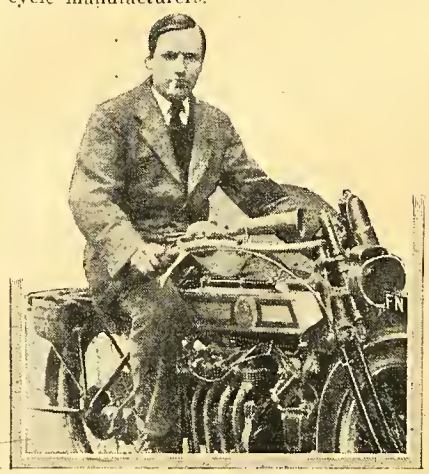
One day last week Mr. T. W. Loughborough, A.M.I.A.E., secretary of the A.C.U., was entertained at Durham by the North-eastern Centre of the Union, when he addressed a large gathering of north-eastern motor cyclists on motor matters generally.

Private Bills in Parliament.

Several Corporation Bills have been deposited in Parliament, which the Legal Department of the R.A.C. are closely watching. Liverpool, Preston and Burnley want it made compulsory for the driver of a motor vehicle to stop when passengers are boarding or alighting from a tramcar, while Hoylake includes a clause making it obligatory on drivers not to drive at a greater rate than 5 m.p.h. while passing a church, chapel, or other place of worship during service on Sunday, Christmas Day, or Good Friday.

Less Time, More Work.

We hear that the Indian factory in America is working with approximately 1,300 men from four and a half to five days per week, depending on each department, with absolutely no overtime, to turn out its relative proportion. It is interesting to know that the daily production is greater now than it was five months ago, when the factory was on full time with overtime in the majority of the departments. We understand that the men themselves, realising the general poor business conditions, want to hold on to their jobs, and are giving an honest day's work.



Welding Costs.

Before placing a welding job in hand, it is well to obtain an estimate. We have heard of cases where welding a pinhole in a cylinder has cost more than a new cylinder. The prices of the majority of firms specialising in this work, however, are usually very satisfactory.

Bonuses to Competition Riders.

The British Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., have agreed that members shall not pay any form of bonuses to riders of motor cycles in connection with the use in any competition by such riders of any proprietary article, nor will they give or loan to any rider any such proprietary article or accessory. The underlying reason for the action is understood to be that motor cycle manufacturers desire entire freedom of choice of specifications of components and accessories to be used on their machines to ensure that such machines compete under the best conditions. Accessory manufacturers will therefore not approach riders direct, but will make their arrangements with motor cycle manufacturers.

The late Mr. F. Manning who, in consequence of a regrettable accident, sustained fatal injuries on Brooklands last week. He ran his F.N. into a wooden barrier which, it appears, he had passed several times before whilst circling the track.

Special Features

NOVELTY IN DESIGN AND CONSTRUCTION.

F.I.C.M. CONGRESS AT BRUSSELS.

A Cycle Car Grand Prix.

For the first time the Cycle Car Grand Prix will not be mixed up with motor cycle events. This year the cycle car race will be held on Saturday, Sept. 17th.

The A.C.U. Badge.

The combined badge and licence holder introduced by the A.C.U. costs 5s., but this price does not include the badge itself, as many have understood from our recent description of the device.

Motor Cycle Cure.

W. F. Guiver, a successful competition rider, until a short time ago could only get about on crutches, the result of rheumatism and complications through Overseas service as R.A.F. examiner. On a specialist's advice, he says, he resumed motor cycling, and can now walk with a stick.

The Scottish Show.

Special displays of 1921 motor cycles are being made by Glasgow agents during the Scottish Automobile Show, which opens to-morrow, January 28th, and cycle cars of both types will also be in evidence. The Tamplin will be outside the exhibition, with headquarters at the Clydeview Garage, Clydeview Lane, Partick West.

The Jarrott Cup Trial at Easter.

This event will be run from London to Land's End (single journey) over the same course as last year on March 26th. To qualify for a gold medal every competitor must make a clean ascent of the two observed hills—Porlock and Lynton. A new rule precludes any repairs or adjustments being effected at controls. Nothing may be done except the replenishment of fuel and oil tanks. A competitor may not even pump his tyres.

Under Difficulties.

When, in this country, much ink is being spilt on increased taxation and increased subscriptions, an Irish correspondent wonders how some of our indignant "Constant Readers" and "Working Men Motorists" would regard their lot if it were placed in his distressful country. Writing from Larne, co. Antrim, this reader states that a permit is necessary for motoring *within* a twenty miles radius of the applicant's home. In his case, which he states is no exception, even this limited permit was refused, and he has been requested to "dispose of the machine to an approved person," or "to hand it over to the military authorities for safe custody," or "to dismantle it in such a manner as effectively to prevent its use." And (the last straw) the new taxation rates apply here as elsewhere.

World's Records.

Class A1 (275 c.c.) is not included in the world's records compiled at Brussels last week.

A Martinsyde Rumour Denied.

Notes appearing in the daily press concerning Martinsyde, Ltd., have created an erroneous impression. The report that 500 men were discharged and the factory closed down is entirely without foundation, and arises from the fact that certain departments were so much ahead of others that a certain number of men were temporarily suspended. The company is not in liquidation, as is supposed by some to be the case.

German Ignition Appliances.

Apropos our last week's references to German-made ignition appliances, it is interesting to know that ex-service men at least will not sell goods emanating from our late enemies. Last week a Birmingham firm, composed of ex-service men, offered American Bosch pattern plugs at 2s. 6d. each, but on receiving deliveries they found that they were palpably German-made and returned them irrespective of the financial loss involved. All moneys will, of course, be returned to those who ordered the plugs.

Guarantees Against a Fall in Price.

So sure are certain agents and manufacturers that present prices will prevail for some time, they are undertaking to refund any difference in price before a specified date. H. Taylor and Co., of South Kensington, make this offer on machines purchased now, guaranteeing any price adjustment before March 31st, while Rudge-Whitworth, Ltd., make the dates between February 1st and May 31st. F. B. Roper, the Sheffield agent, gives a similar guarantee.

LIVERPOOL TWO-DAY TRIAL.

One of the best known pre-war figures in the big Reliability Trials, Harold Karslake, who piloted a Brough.

The Fastest Motor Cycle.

Over 108 m.p.h. is the world's record highest speed, at present held by the Indian motor cycle.

The Belgian Grand Prix.

The Belgians, who are taking a keener interest than ever in motor cycling, are very enthusiastic over their Grand Prix in August. It is unfortunate that their internal affairs are interfered with by the secession of certain motor cyclists to the Union Vélocipédique, but the F.M.B. will carry on all the same. We believe there is similar trouble in the Danish camp.

An Old-fashioned View.

In Denmark motor cycles are classed among the luxuries which at the present time are not allowed to be imported. Several orders for motor cycles were placed at Olympia pending permission to import them, but so far the Danish Government adhere to their old-fashioned view, which is somewhat surprising, since it is one of the largest cycling countries in the world.

A MEMORIAL TO A BRAVE DIVISION.

Situated on the Dunchurch Avenue, between Coventry and Dunchurch, on the London-Holyhead road, this monument was erected in honour of the men of the immortal 29th Division who fell in Gallipoli. King George reviewed the Division on this spot previous to its departure for the Front. Near where is stationed the car, this famous high road is intersected by the old Roman Fosseway.

Congress of World's Motor Cyclists' Representatives.

World's Record List Compiled by F.I.C.M. at Brussels. New International Rules Passed.

THE two most important results of last Thursday's International Congress at Brussels are the compilation of the first complete list of world's records, in which American records make their first appearance, and the final passage of the international competition rules, under which all international events must be run in future.

A special sub-committee, consisting of Messrs. Jules Neher (chairman), G. de Ro, G. Fenton, and T. W. Loughborough (secretary), met at 10 a.m. to consider the rules. These rules had been passed at the meeting in Paris on August 3rd, 1920, as being fit to send out to the various governing bodies for their approval. Certain amendments were considered, and the rules were then ready to be submitted to the Congress. The rest of the meeting dealt with the claims to world's records, and, while considering this subject, it was found that Italy's claims could not be substantiated, as the records had been previously beaten in America.

Eight Countries Represented.

Certain proposed amendments to the competition rules were then examined, but it was finally decided to make no alteration. At 12.30 the members of the Congress adjourned to the appropriately named Taverne du Globe in the Place Royale, where they were entertained to lunch by the Royal Automobile Club of Belgium.

The gathering was one of the most representative of its kind which has yet met, no fewer than eight countries being represented. Three new delegates attended: Count Bonacossa (Italy), a thorough enthusiast and a most active and useful member, who rides a Rudge; Mr. E. Höst (Denmark); and Flight-Lt. Kindberg (Sweden), an expert pilot, and a skilful rider of an A.B.C.

Following is a list of those present: Baron Nothomb, in the chair (the Royal Automobile Club of Belgium); M. Jules Neher (Union Motocycliste Suisse), vice-president; Mr. W. H. Wells (Motor Cycle and Allied Trades Association of America); M. E. Collignon (Competitions Committee Fédération Motocycliste Belge); Mr. Greame Fenton and M. G. Longuemare (Union Motocycliste de France); Mr. A. V. Ebblewhite (A.C.U.); M. G. A. de Ro (R.A.C.B.); Mr. E. M. P. Boileau (A.C.U.); M. M. Fagard (President F.M.B.); Count Alberto Bonacossa (Moto Club d'Italia); Mr. E. Höst (Dansk Motocycle Union); Dr. Lamborelle (chairman Competitions Committee F.M.B.); Flight-Lt. E. Kindberg (Svenska Motor Cykel Klubben); and Mr. T. W. Loughborough (A.C.U., and general secretary F.I.C.M.).

A New Vice-president.

After being lavishly entertained by the R.A.C.B., the Chairman welcomed the delegates in a speech which was short but to the point, to which M. Neher replied.

Those present then returned to the premises of the R.A.C.B. shortly after 3 p.m., when the congress sat with Baron Nothomb in the chair. The minutes of the meeting in Paris on August 3rd last were read and confirmed. To the list of existing vice-presidents it was decided to add the name of Count Alberto Bonacossa, to occupy the vacancy occasioned by the death of the late Mr. A. W. Torkington.

Trials and Races.

Arising out of the minutes it was decided to deal with the international competition rules, now revised and brought thoroughly up-to-date. Considerable discussion then arose. M. Longuemare suggested the inclusion of a special class for scooters and bicycles with auxiliary motor attachments. M. Neher replied that these were adequately catered for in the 275 c.c. class. Some objection was then raised by the French representatives to the omission in the amended rules of the regulation compelling all motor cycles, whether used for races on the track or for attempts at record, being fitted with a clutch and change speed gear, and it is necessary to explain here that our Continental friends have not yet learned to distinguish between a race and a reliability trial. The word *course* race is too freely used, and is often employed when *concours de durabilité*—reliability trial—is intended. The result is that an attempt was made to compel purely racing machines, such as are used for speed trials and record attempts to conform to the same requirements as those laid down for motor cycles competing in reliability trials.

Countries Represented:

Great Britain	*America*
France	*Belgium*
Italy	*Sweden*
Denmark	*Switzerland*

The new official list of world's records includes many American figures, including the Indian records of over 108 m.p.h.

Class A1 (275 c.c.) is eliminated, as are alt kilo. and mile records made in one direction only.

Racer or Tourist Machine?

Mr. W. H. Wells pointed out that such fittings tended to slow the machine and strenuously opposed the proposition.

Mr. E. M. P. Boileau pointed out that, probably for the reason given above, the difference between a machine stripped for record breaking and a motor cycle used in a reliability trial, or in a race in which touring conditions had to be observed, was not clearly understood. After considerable further discussion it was unanimously decided to leave things as they were. The most important amendment which was duly carried was the new silencer rule. At the Paris meeting the regulations affecting silencers attempted to limit the orifice of the exhaust pipe scientifically, but this was found to be unworkable, consequently an amendment had to be made, and this reads as follows: "All motor cycles taking part in any competition must be fitted with an efficient silencing system as may be required by the rules governing such competition, but in races a free exhaust may be permitted. In all cases the exhaust gases must be so ejected as not to raise dust or to be otherwise dangerous to a competitor. Uncovered exhaust ports in the walls of the cylinders are forbidden in all competitions."

Count Bonacossa then raised several important and interesting questions relating to the making of, and verification of, record attempts, with the result that the following proposals were adopted: "The distance covered must be verified by a qualified surveyor, the cubical capacity of the engine must be verified by an official measurer, and a certificate as to the time must be presented by an official timekeeper. The course, in the case of all attempts at records of less than two kilometres in length, shall not in any part have a gradient exceeding .5 per cent. (1 in 200) from the horizontal."

The international competition rules were then unanimously adopted. The final amendments have just been referred to, and the previous amendments which were confirmed were published in *The Motor Cycle* of August 12th, 1920 (p. 182). These rules will now form the basis for all events open to competitors from foreign countries, such as the Tourist Trophy Races, the Auto Cycle Union Six Days Trial, the International Six Days Trial, the Grand Prix of the U.M.F., etc.

Spain Admitted.

M. Longuemare pointed out that, although he understood that these rules were to come into force as from January 1st, they had not been confirmed in time for certain events now in process of organisation. In reply, it was pointed out that these rules must apply from the date named, but that in any case of hardship the governing body of the country concerned should have authority to deal with the matter on its merits.

The Real Moto Club de España was next received into the Federation. It was decided that the next meeting of the F.I.C.M. should be at Geneva on the 8th August at the conclusion of the International Trial.

The question of the control of cycle cars was discussed, and the General Secretary stated that he had written on November 25th to the secretary of the International Association of Recognised Automobile Clubs, but had received no reply. M. Georges Longuemare offered to take up the matter with the Automobile Club de France immediately on his return to Paris, and the matter was deferred.

A financial statement of the F.I.C.M. was duly presented and adopted. Count Bonacossa suggested that a handbook of the Federation should be drawn up in French and English. The suggestion was adopted.

Mr. Boileau proposed that a fixture list of each body belonging to the Federation should be presented at the

Congress of World's Motor Cyclists' Representatives.—

first meeting in every year, so that the Federation should be made aware of those international events which were worthy of support. This was agreed to.

Motor Cycles in the Olympic Games?

The General Secretary was instructed to apply to the organisers of the Olympic Games so as to make application that motor cycling should be accounted as one of the sports duly recognised. Count Bonacossa proposed an international race for a challenge trophy, to be run on the lines of the T.T., but to be held in a different country each year, each country to be represented by not more than three teams, the first event to be run on the Circuito di Brescia on September 11th.

Votes of thanks were accorded to Baron Nothomb and M. Jules Neher. The meeting came to an end at 7 p.m.

World's Records.

Pending the compilation of a list of world's records, the following information will allow the reader to gain an idea of the ultimate details of the list. Referring to the records to date published in the issue of January 6th, 1920, Class A1 (275 c.c.) is eliminated, as are also all kilometre and mile records made in one direction only. It must be borne in mind that, as a result of the putting of these records on a proper basis at the recent meeting of the F.I.C.M., no announcement may be made by manufacturers or others claiming world's records unless the class is stated. An infringement of this rule renders the offender liable to severe penalties. The following additions must be made to the lists previously given as British records.

AVERAGE MEAN SPEED RECORDS.

CLASS C.—500 C.C. APRIL 15TH, 1920. DAYTONA BEACH.			
Flying Km.—E. Walker, 1-cyl. Indian, 82.5 × 93 (497 c.c.)	27.21 sec.	..	82.21 m.p.h.
Flying Mile.—E. Walker, 1-cyl. Indian, 82.5 × 93 (497 c.c.)	43.85 sec.	..	82.09 ,,
Flying 5 Miles.—E. Walker, 1-cyl. Indian, 82.5 × 93 (497 c.c.)	3 min. 30.11 sec.	..	85.26 ,,
CLASS E.—1,000 C.C. APRIL 14TH, 1920. DAYTONA BEACH.			
Flying Km.—E. Walker, 2-cyl. Indian, 82.5 × 93 (994 c.c.)	21.60 sec.	..	103.35 ,,
Flying Mile.—E. Walker, 2-cyl. Indian, 82.5 × 93 (994 c.c.)	34.70 sec.	..	103.74 ,,
Flying 5 Miles.—E. Walker, 2-cyl. Indian, 82.5 × 93 (994 c.c.)	2 min. 15.02 sec.	..	108.68 ,,
CLASS G.—500 C.C., WITH SIDECAR. SWITZERLAND.			
Flying Km.—Gex (Motosacoche sc.)	40.8 sec.	..	54.82 ,,
CLASS I.—1,000 C.C. WITH SIDECAR. FEBRUARY 17TH, 1920.			
Flying Km.—L. Parkhurst, 2-cyl. Harley-Davidson sc., 84.1 × 88.9 (988 c.c.)	27.30 sec.	..	81.94 m.p.h.
Flying Mile.—L. Parkhurst, 2-cyl. Harley-Davidson sc., 84.1 × 88.9 (988 c.c.)	43.85 sec.	..	82.09 ,,
Flying 5 Miles.—L. Parkhurst, 2-cyl. Harley-Davidson sc., 84.1 × 88.9 (988 c.c.)	3 min. 34.52 sec.	..	83.90 ,,

Continental Competitions—Hints to the British Trade.

We dealt pretty fully with the question of 1921 competitions in the leading article which appeared in the issue of the 13th inst., wherein it was stated that after the F.I.C.M. congress a clearer idea of 1921 competitions abroad would be obtainable. This has proved to be the case, and we are now able to give the British motor cycle trade and private owners some useful advice based on enquiries and observations made, so to speak, on the spot. The amateur or private owner, who has private means, and is out for fun and interesting experiences, may do well to support such events as the Paris-Nice or Paris-Madrid trials, but as there is not a hill worthy of the name in either event, it is necessary to point out that neither of these competitions is worthy of the expense entailed for the trade to support it.

First and foremost the International Six Days Trials run by the Union Moto Cycliste Suisse, starting from Geneva on August 1st, is the most important of all the events to be held on the Continent this year. The organisers are a business-like body who may be trusted to run a really valuable trial; they have found an excellent course, and British makers who value their Overseas trade should concentrate in this trial which, owing to the nature of the country in which it is held, will provide lessons which cannot be learned in Great Britain.

Next in importance is the Grand Prix of the U.M.F. to be held at Le Mans. The French thoroughly understand the running of speed events, the course can be reached from England with the minimum amount of expense, and the event is well worthy of support. The Belgian Grand Prix is also worthy of consideration, while equally noteworthy is the race recently proposed by the Italian delegates to the F.I.C.M. to be run in Italy over the Brescia circuit on September 11th.

F.I.C.M. NOTES.

Visit to the F.N. Factory.

On the day following the Congress a number of the delegates accepted the invitation of the directors of the Fabrique National d'Armes de Guerre to visit the F.N. factory at Herstal, near Liège. While in the town MM. Fagard and Collignon, who are residents there, made

MAKING THE ROADS SAFER.

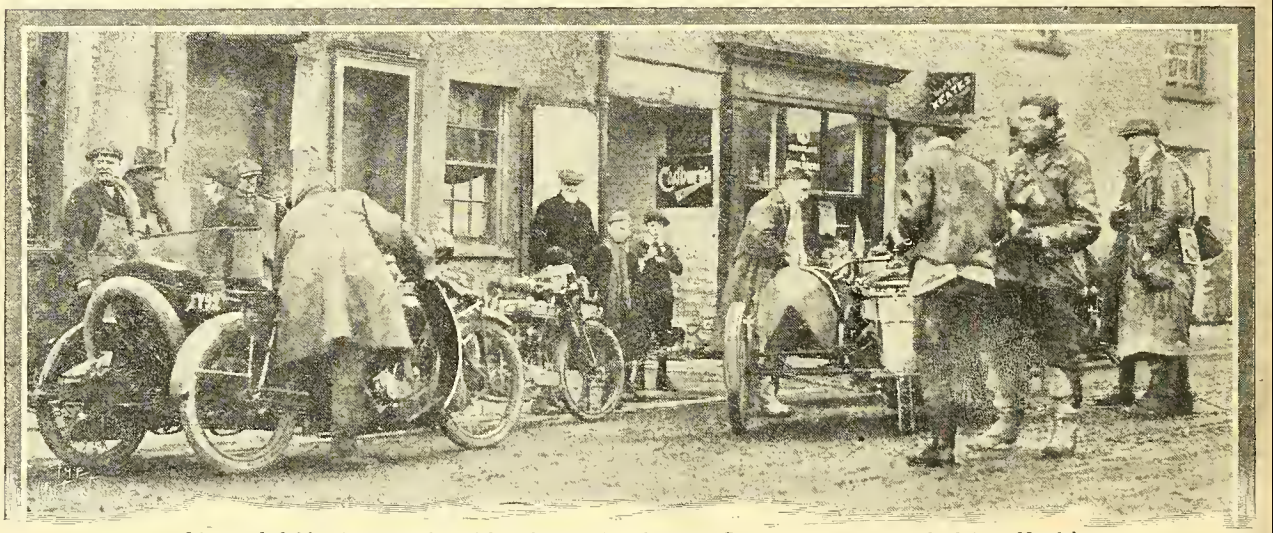
In various parts of the country there is evidence of activity to improve the roads and to make them more suitable for present day conditions. Here work is in progress widening a dangerous corner on the well frequented Coventry-Stoneleigh road. The railings in the background show the extent of the widening.

Congress of World's Motor Cyclists' Representatives.—

the visitors their special care, and first drove them round the picturesque city. At ten o'clock cars sent by the F.N. Co. conveyed the delegates to the factory, where a very interesting morning was spent visiting one of the most famous works on the Continent. It is clear that the accuracy in workmanship, careful viewing, and excellence of material have brought the F.N. motor cycle to the high standard it has now reached. The company were entertained to lunch by the directors, M. Gallopin, occupying the chair. M. Kelecom (who often visits England) and M. Meghi showed the party round the works.

When it is remembered that the Germans denuded the whole works of machine tools and left the shops filled with broken-down lorries, the sight of this hive of industry and its marvellous recovery are simply astounding.

World's Records.



Mr. A. V. Ebblewhite, the A.C.U. timekeeper, attended the meeting specially to aid in settling the question of world's records, which the International Federation has now placed on a satisfactory basis.

An Italian Sportsman.

Count Bonacossa, the new vice-president, is certainly an acquisition to the Federation. He is not only an active motor cyclist, but is also active and useful in Congress. When he missed the connection at the frontier last August, owing to the overheating of the axle of the sleeping car, he attempted to reach Paris, first by motor car, and then by aeroplane, but none were available.

A TWO DAYS WINTER TRIAL.

Liverpool M.C. Touring Test to Edinburgh and Back.

Liverpool club's winter two-day trial to Edinburgh and back. Competitors waiting to check in at Kendal.

AINTREE, near Liverpool, was the scene of the start of a winter touring trial, which attracted an entry of forty-one, last Saturday morning.

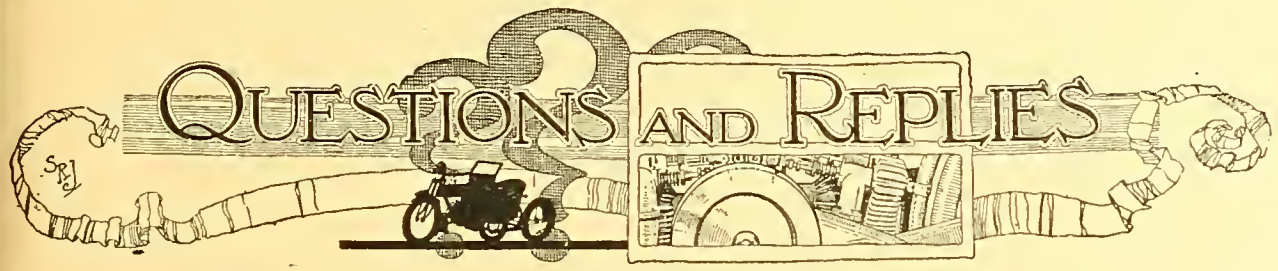
The Liverpool Motor Club organised the run on very free and easy lines, for, on the outward journey to Edinburgh, there was only one check (at Kendal), while on the return run there was again only one check, which was situated near the top of Kirkstone Pass at the end of a four miles non-stop section, commencing at Patterdale.

Variable weather and a gusty north-westerly breeze worried the competitors the whole way north, and the going was very heavy in places. Solo riders especially found some terribly skidsome patches, notably on Shap, and again near Hawick.

Tyre Troubles.

There were two retirements early, these being W. Johnson (2¾ Ruby) and E. N. Dean (4 Wilkin), but otherwise there appeared to be few troubles. A machine noted with some interest was one of the new T.T. Sunbeams ridden by J. F. Burns, and it appeared to be particularly steady on grease. About Lancaster W. J. Winter (3½ N.U.T.) had tyre trouble, and subsequently, when over the Border, suffered a bad burst on a rough section of road. He was thrown, and severely damaged both himself and the machine, being thus compelled to retire.

The following checked in to Alexander's Garage, Edinburgh, well up to schedule time: Hugh Gibson (8 Royal Ruby sc.), J. Roddick (8 Zenith), S. V. Banner (8 Sunbeam sc.), J. F. Burns (3½ Sunbeam), R. G. Taylor (3 A.B.C.), J. G. Collins (6 A.J.S. sc.), H. F. Brockbank (8 Blackburne sc.), H. J. Scale (3½ New Scale), F. Highfield (3½ Beardmore), N. C. Sclater (3½ Norton), J. L. Jenson (7-9 Harley-Davidson sc.), S. Bartley (6 A.J.S. sc.), N. H. Brown (7-9 Indian sc.), F. Gunton (2¾ Dalton), J. Lee (7-9 Indian sc.), D. G. Prentice (8 Morgan), W. Cottle (4½ B.S.A. sc.), J. H. Green (6 Martinsyde sc.), H. Karslake (5 Brough), S. Parker (8 Matchless sc.), F. E. Marsden (8 Sunbeam sc.), V. Horsman (10 G.N.), H. Burrill (3½ Rudge).



M. Deeley (4 Triumph) arrived late, no doubt having found his wheel discs disadvantageous in the gusty winds on the Teviothead moorlands, while A. Ellison (8 Zenith) unfortunately ran out of petrol about five miles from Edinburgh and checked in late.

The start of the next day's run was made at 8 a.m. under perfect weather conditions, but as the high Border county was reached rain fell heavily. It did not seem so easy to maintain the same speeds as on the previous day, for the roads were very heavy.

Amongst those running consistently may be mentioned N. C. Sclater (3½ Norton), F. Highfield (3½ Beardmore), H. Karslake (5 Brough), and the Ruby, Sunbeam and A.J.S. sidecars. No one definitely knew the position of the time check on Kirkstone Pass, and in consequence there were many variations, most of the solo men being early. As at all the other checks, Hugh Gibson's 8 h.p. Royal Ruby outfit was dead on time, this despite the fact that the back tyre punctured only fifty yards before the non-stop section commenced and the wheel had to be changed.

Bad Weather Conditions.

Very heavy rain was encountered on the descent to Kendal, and the weather conditions were unpleasant onwards to the finish where the following checked in within qualifying time: H. Gibson, J. Roddick, S. Banner, J. Burns, J. Collins, H. Brockbank, F. Highfield, N. Sclater, J. Jenson, F. Gunton, D. Prentice, J. Lee, J. Green, H. Karslake, S. Parker, V. Horsman, and A. Ellison. The results of this long and heavy trial will be announced later.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

CHARGING FROM ALTERNATING CURRENT.

How are accumulators charged from the house mains? The current is 200 volts alternating.—H.A.T.

It is impossible to charge accumulators from an alternating current without the use of some form of rectifier which will convert the current to continuous. Unless you have a large number of accumulators to charge, the expense of installing this apparatus would be excessive.

DIFFICULT STARTING.

I have a 1919 single-cylinder model which is very difficult to start by means of the kick-starter, and I should be obliged if you could let me know if there are any means of making it easier. It starts easily when hot.—T.S.

The trouble is no doubt due to the design of the starting apparatus. A certain amount of the power expended on the starting pedal is lost in overcoming the friction of the oil between the clutch plates in the three-speed gear box. A very thin oil should be used to lubricate the gears, and this will, to some extent, facilitate starting. You should, of course, ascertain that there are no air leaks in the induction pipe, that the inlet valve is a good fit in its guide, and that both valves are holding compression. Ignition should be almost fully advanced, and an injection of petrol in the cylinder will help matters.

MALLEABLE LUGS.

In co-operation with a friend I am considering the building of a sidecar chasses (folding type), but am in difficulty as regards the elbows, T pieces, and special bends which would be required to piece up the steel tubings. Is malleable iron suitable for these? I can procure these all right (*i.e.*, steam or hot water screwed fittings), and intended fitting 1⅛in. cycle tubing in the main parts with 1in. for the cross stays, etc. One cycle builder told me all cycle fittings were malleable, but I know some are steel pressings and thought the castings wouldn't stand the road shocks.—A.E.S.

Motor cycle frame and sidecar chassis lugs are usually malleable castings, and it would be better for you to obtain them from a firm specialising in this class of fitting. Some manufacturers use steel castings or pressings, but you might find more difficulty in obtaining these. On no account use hot-water fittings.

V TWIN FIRING ANGLE

In the case of a 50° twin V engine, why should the magneto cams on the contact breaker be offset to half cylinder angle, *i.e.*, 25° instead of being diametrically opposite?—R.J.R.

Your query is not absolutely clear, but, as we read it, we think the following explanation should be what you require. It is obvious that a twin-cylinder engine with cylinders at 50° and a common crank will not fire at equal intervals. Since each cylinder fires only once in two revolutions, the firing intervals will be 360° plus 50°, and 360° minus 50°. Since the magneto runs at half crankshaft speed, the reason for the offset of 25° should be clear.

Important Dates.

Jan. 28th to Feb. 5th—
Scottish Motor Exhibition Kelvin Hall, Glasgow

March 25th—
Richmond Meet.

March 26th—
M.C.C. London-Land's End Trial.

April 27th—
A.C.U. One-day Winter Trial for Stock Machines.

May 14th—
M.C.C. London-Edinburgh Run.

May 25th—
A.C.U. Silencer Trial—Brooklands.

June 14-16th—
Tourist Trophy Races.

July 22nd—
Grand Prix Race—Le Mans.

STARTING A TWO-STROKE.

I have recently purchased a new 2½ h.p. two-stroke motor cycle, and have to push off three or four times, before I can get it running. I have carefully examined the carburetter, which appears to be all right; also adjusted the platinum points of the magneto to the gauge, and tried a new plug with no better results. I push the machine off in low gear.—C.C.T.

The difficult starting may be due to air leaks at the induction pipe, or at the joints between the cylinder and crank case, or between the two halves of the crank case itself. To ensure an easy start, well flood the carburetter and advance the ignition fully or almost fully. The gap between the sparking plug points should not be too close—try about 3-64th inch—for it is only a popular fallacy that a narrow gap improves starting.

TWO-STROKE OR FOUR-STROKE.

I am thinking of purchasing a lightweight motor cycle (2-3 h.p.), which I shall use regularly through the summer, and part of the winter for a ten-mile journey every morning and evening, but I cannot decide between a four-stroke or a two-stroke, though I am rather inclined towards the former. I shall be very glad if you will give me your opinion of them, or rather compare them for me, with regard to petrol economy, ease of starting from cold, average miles per gallon of the two classes, running expenses, adaptability to benzole, general reliability, etc. I have ridden my father's 6 h.p. outfit, but that is all the experience I have had, so I regard myself more or less as a novice.—L.N.M.

You would find either a two-stroke or four-stroke lightweight almost equally satisfactory. Given two engines of the same capacity the two-stroke will be rather more powerful, but its consumption is higher, usually being about 88 to 90 m.p.g. as compared with 100 to 120 m.p.g. of the four-stroke. Ease of starting is about equal, the small two-stroke probably having a slight advantage. Benzole is equally suitable for both.

TIMING QUERIES.

I have recently purchased a 4 h.p. twin Peugeot motor cycle in parts, and have overhauled it ready for assembling. Being a novice with twin engines, I should esteem it a great favour if you would kindly instruct me in the timing of this particular engine. The timing wheels are marked in two or three places. The inlet valves are overhead, automatic. *Re* ignition timing. Should the cylinder nearest to the magneto fire first? The magneto is a Bosch. Carburetter is B. and B. (pilot jet), late pattern.—J.H.W.

The timing of the engine is as follows: Inlet, automatic. Exhaust: the valves should be timed so that they close when the piston reaches the top of the stroke, and if they are set according to this plan there is no need to consider their opening; it will be automatically correct. Ignition: the spark would occur when the piston reaches the top dead centre of the compression stroke, the ignition control being two-thirds retarded. Bosch magnetos are usually numbered 1 and 2 on the terminals. These numbers correspond to the numbers of the cylinder, which are 1 and 2 in the direction of rotation—that is, the back is No. 1.

MAGNETIC LINES OF FORCE.

Would you kindly give me an approximate expression for the flux provided by a permanent (magneto) magnet, when pole pieces and armature are in position, in terms of the dimensions of the magnet?—C.E.C.

The expression for a good quality magneto magnet is 10,000 lines per square centimetre—the total being 20,000—50,000 according to size.

BAD STARTING ON OLD MACHINE.

It is practically impossible to start my 4 h.p. single even with a running mount, yet everything seems to be in perfect condition. Priming takes no effect. I imagine the trouble to be the carburetter, which is a B. and B. (old pattern). Do you think I should get better results if I fitted a new one?—G.R.G.

You would probably get better results with a new carburetter; but we do not think that the trouble lies entirely in this direction. Probably the inlet valve guide is very much worn, and an air leak at this point will most certainly cause difficult starting. The spark should be almost fully advanced, and should occur when the piston is 8 to 10 mm. from the top of the compression stroke.

REFUSAL TO RUN SLOWLY.

My motor cycle is a 1920 Omega-Jap, and until quite recently I could keep the engine just ticking over perfectly smoothly on low gear, which was very convenient when I was in traffic. During the last few days it has lost all its smoothness when in low gear, and tends to fire irregularly. This is coupled with eight-stroking when starting. I am at a loss to remedy this, and should be pleased with your advice. The carburetter is a B. and B., and magneto C.A.V. At all speeds over 6 or 7 m.p.h. the machine runs perfectly.—W.L.S.

The details you give are insufficient to enable us definitely to say what is the cause of your trouble. It may possibly be due to the mixture being too rich; this would be brought about by the raising of petrol level due to wear of the float chamber needle seating. You can tell if this is so by noticing whether black smoke is thrown out from the exhaust. Should you now find that the machine needs a much wider throttle opening to keep the engine running, you may assume that the trouble is due to an air leak, probably at the inlet valve guide which has become worn. Notice also that the magneto rocker arm is working quite freely.

EXPERIENCES WANTED.

Valkyr (South Shields).—Most suitable driving costume for lady.

"Dews-berry" (Dewsbury).—Flat-twin Harley-Davidson with sidecar.

"K.B 1036." (Earlestown). — H.A.H. electric rear light set on rigid frame machine.

"G.A.B.W." (London, S.E.).—Tamplin cycle car. Seating comfort with passenger, reliability, and stability on grease.

"L.C.C." (Harringay).—4¼ h.p. B.S.A. outfit with adult passenger and child (age six): m.p.g., speed, cost of upkeep.

RECOMMENDED ROUTES.

RETFORD TO WARRINTON.—D.F.

Retford, Worksop, Barlborough, Chesterfield, Baslow, Bakewell, Buxton, Macclesfield, Chelford, Knutsford, Mere Corner, Warrington.

BIRMINGHAM TO TETBURY.—S.S.

Birmingham, Alcester, Evesham, Cheltenham, Painswick, Stroud, Nailsworth, Tetbury.

LINCOLN TO SOUTHWOLD.—A.E.P.

Lincoln, Sleaford, Swineshead, Wigtoft, Fosdyke, Long Sutton, King's Lynn, Stoke Ferry, Thetford, Diss, Scole, Harleston, Halesworth, Blythburgh, Southwold. Approximately 145 miles.

A scene at the recent meet of the Hertfordshire Hounds on Harpenden Common. Motor cycles were in evidence, as they always are when sport of any sort is concerned

SPARKLETS

Altered Exeter Award.

We understand that S. E. Longman, who rode a Harley-Davidson in the London-Exeter, has now been awarded a gold medal instead of a silver medal, as previously announced. Out of thirteen starters eleven Harley-Davidsons gained gold medals, which is certainly a high percentage.

To Home Enamellers.

Those riders who devote the dull season touching up their machines in preparation for the bright days of spring, should not fail to send to Messrs. Jenson and Nicholson, Ltd., of Stratford, E.15, for a colour card of Robbialac enamels. Along with it they will receive a useful folder entitled "Instructions for Amateurs to Enamel a Cycle or Motor Cycle."

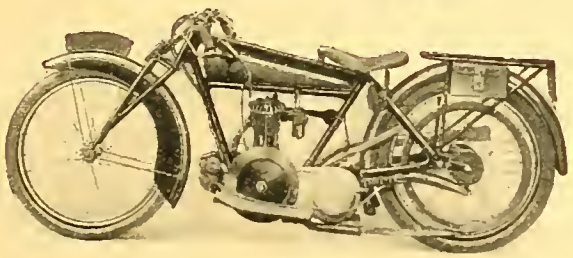
Graphited Lubricants.

A booklet entitled "Foliac" has been received, and its pages describe various Foliac motor graphite compounds, which consist of graphite mixed with various types of greases; these are produced by Graphite Products, Ltd., 218-220, Queen's Road, Battersea, S.W.8. Reference is also made to Foliac Silica graphite paint for painting exhaust pipes and silencers.

Catalogues Received.

Armis Cycle Co., 290-1, Heneage Street, Birmingham. A list containing pictures and specifications of Armis machines equipped with Precision two-stroke and J.A.P., 2¾ h.p. and 5-6 h.p. engines. Both the 350 c.c. two-stroke and the 5 h.p. twin models are listed as sidecar outfits.

Whitley Manufacturing Co., Ltd., Charterhouse Mills, London Road, Coventry. Particulars of the Whitley sidecars, which are specially noteworthy for the sound design of the attachments. These are made to secure a particularly rigid grip on a number of standard motor cycle frames.



Coventry Eagle Cycle and Motor Co., Coventry. The 1921 catalogue and price list of the Coventry Eagle motor cycles. Lightweights fitted with J.A.P. or Villiers engines, and mediumweights with either King Dick single (500 c.c.) or J.A.P. twin (680 c.c.), are included, but the latter models may be had with sidecars. For those who want additional comfort, single frame springing device is listed as an extra for any model.

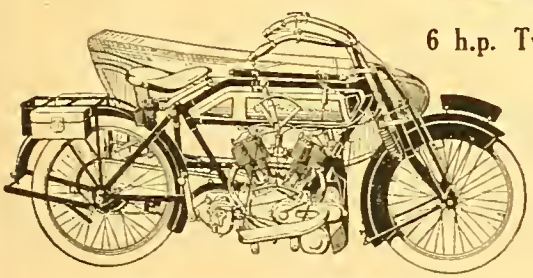
Alldays and Onions, Ltd., Matchless Works, Birmingham. A particularly well illustrated booklet, showing technical details of the Allon machines. The description of the light sidecar outfit is worth noticing, as are the running instructions on the final pages. During the Scottish Show, which commences tomorrow (Friday), Allon machines will be exhibited at the show rooms of Messrs. Rossleigh, Ltd., 532, Great Western Road, Glasgow.

COULSON-B

—the Successful Motor Cycle; 2¾ and 4 h.p. Solo and Sidecar.

4 h.p., Less than 200 lbs.

H.G.L. 19/1/21



THE Coulson-B has well earned the description "successful." Its repeated consistent wins in competitive events of every possible kind; its outstanding achievement in its run from London to Edinburgh (2¾ h.p. and Sidecar) without stopping the engine; its nine World's Records for similar combination—all these obviously point to a Motorcycle of far more than ordinary merit.

And the more you investigate the claims of the Coulson-B the more will you be impressed by its high qualities, the more clear will it be that here is the machine you have been looking for. Although light in weight, its splendidly balanced design gives it marvellous strength and reliability under the most arduous conditions; while its master-sprung frame protects rider and mount alike from shocks and jars, no matter how bad the roads may be.

Scottish Motor Show

Messrs. BELL BROS. 238-250, Gt. Western Road, GLASGOW, W. extend a cordial invitation to their friends to visit their Showrooms, where a full range of Edmund Models will be on display.

C. EDMUND & CO. (1920), LTD., Crane Bank, CHESTER.

Rigidity

Increased strength and greater rigidity are the leading characteristics of the Motor Cycle frame built up with

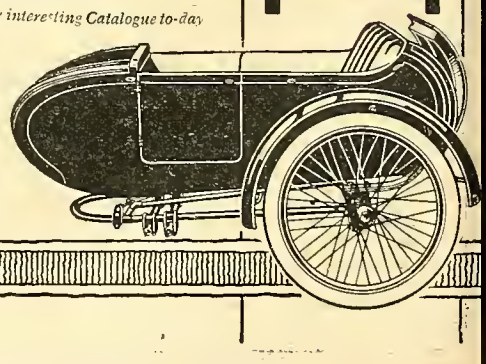
REYNOLDS' BUTTED TUBES.

These famous Tubes are expressly designed to overcome "frame weakness" and, used in the construction of Motor Cycle Frames, will lengthen the life of the machine, increase its value, eliminate all tendency to "whippiness," and add immeasurably to the safety and comfort of the rider.

Remember that the 1920 Senior T.T. Race was won on a "Reynolds-butted-Tube-built" machine, and then select your mount accordingly.

The Patent Butted Tube Co., Ld., Hay Hall Works, Tyseley B'HAM.

Canoelet



The

Peerless Sidecar

Whether you judge by beauty in design, exquisite finish, maximum utility, perfect balance, smooth running, or strength and durability, Canoelet Models stand supreme. "Bicycling News" says: "One Canoelet Lightweight Model appeals to us as the most comfortable design in seating accommodation we have yet seen."

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/—, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable & Co. to ILIFFE & SONS Ltd., and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

WE WANT YOU

to see for yourself the extreme value we are presently offering, of **Brand New 1920 Models,** at hitherto unheard of prices.

Our List certainly gives all details, but there are many buyers who like to see exactly what they are getting, and to make sure the Machines are as represented.

We therefore make the following

UNPRECEDENTED OFFER

of a FREE JOURNEY to EDINBURGH or GLASGOW,

to each Buyer of a machine from our Sale List.

Come from any part of Great Britain, select your machine from our gigantic Stock, at our already greatly reduced price, from which your train-fare will also be subtracted.

If your time is short—travel overnight—we will give you lightning service if desired, and you can be on your return journey, either by road or rail, within an hour or two.

How does this appeal?

Send us your enquiry, and get our List which will firstly show it's worth your while to visit us

A HEARTY INVITATION TO ALL FROM LAND'S END TO JOHN-O'-GROAT'S!

This offer lasts till February 5th and supersedes all other offers.

If you give us a slight indication of your requirements, we will advise you whether it would be better to visit Edinburgh or Glasgow for the greater selection of the type of machine required.

ALEXANDER & CO.,

113-115, Lothian Rd., EDINBURGH,
AND
272-274, Gt. Western Rd., GLASGOW.

(Time is short—write us at once!)

WHAT BETTER?

Selling goods of proved merit is a pleasure, and that pleasure passes on to the user. As a discriminating motor cyclist you should buy brands that have **proved themselves** in trials and races, from agents who have ditto ditto'd You then get good goods at once and good service hereafter.

VICTOR HORSMAN
LIMITED,
7, Mount Pleasant, LIVERPOOL.

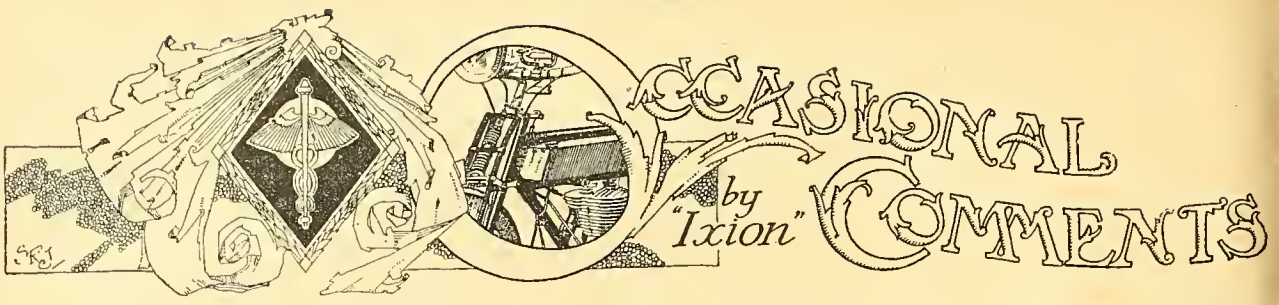
The Speed Limit.

IT has become general knowledge that recommendations regarding motor cycles and motor cars, their speed limits and drivers' licences, will shortly be made to the Minister of Transport by the Departmental Committee on the Regulation of Road Vehicles. The A.C.U. is about to place the views of motor cyclists on these questions before the Government, and at the next meeting of the General Committee at Shrewsbury, on February 12th, the whole question will have consideration. Both the A.C.U. and the A.A. are circularising their members as to their views on these important questions.

The matter is one of great difficulty, and motor cyclists asked by the bodies as to their views would, we think, undoubtedly state with little hesitation that the abolition of the speed limit altogether would be most desirable. There is no doubt that a speed limit in itself is a very arbitrary means of regulating the driving of a motor vehicle. Take, for instance, a town in which a ten mile an hour limit is imposed. On a market day this speed is quite in order and may, at times, be too fast for the amount of traffic on the road. But take the same town at five o'clock on a summer morning; obviously the ten mile speed limit at this time of day is perfectly ridiculous. Fifteen or twenty miles an hour would be absolutely safe. Also, it is clearly absurd to place any speed limit on certain fast stretches of road in this country. On the other hand, there is a feeling that if the speed limit were removed altogether too much power would be placed in the hands of the magistrates as to the interpretation of Section 1 of the 1903 Act (Driving to the Common Danger). It is also possible to argue that a Bench of magistrates may decide on any speed in excess of a certain limit imposed by them constituting "driving to the common danger." Again, to ask for no speed limit at all might well be asking too much, and it is doubtful, even though motorists are unanimous on this subject, whether they will get so generous a concession.

Abolition or Modification?



Another point which can be put forward is that if police traps are abolished it is better to leave things as they are. It is not generally known, but it is, nevertheless, a fact, that there is a speed limit in France, namely, 30 kilometres (19 miles) an hour. This law has become as dead as the ancient law in England that everybody must attend church on Sundays. The latter law is still in existence, and has never been repealed. The speed limit in France is completely ignored, and is only enforced in certain populous places.

There are plenty of speed limits in towns and villages, and very often the smaller the village the smaller the speed limit. It is by no means uncommon to come across a notice stating that the speed for all vehicles is 8 km. (5 miles) an hour.

A number of people consider it would be best to leave well alone, but in this case there is no doubt that the police at any time could enforce the old limit, and, since this is so, it is perhaps better to make a compromise, and raise the speed limit to thirty miles an hour. This is a happy medium between the old limit of twenty miles an hour and no speed limit at all. Thirty miles an hour is a very useful speed, and it is usually found that most motorists drive at something between twenty-three miles an hour and thirty miles an hour, and there seems to be a very fair chance of motorists obtaining this concession.

There is no doubt that the Section 1 regulation to which we have referred requires revision. In the case we have previously mentioned, of a village with a ten mile limit, at 5 a.m. on a summer day a motor cyclist might drive through with perfect safety to himself and everybody else—because no one would be there—at twenty miles an hour, and yet run the risk of being prosecuted for driving to the common danger and for not having taken into consideration "the traffic which might reasonably have been expected to be on the road at the time." This must clearly be altered.

An Index to the advertisements in this issue will be found on the page facing the back cover.

Personal Insurance.

WITH all the care in the world motor cycling adds a trifle to the inevitable risks which we run in passing through this vale of tears, microbes, Kaisers, and Bolshevists; and the wise motor cyclist consequently insures his person as well as his machine. I notice that the wily companies add 15% to the premium on an ordinary "sickness and accident" policy, if one pleads guilty to being a motor cyclist; and I imagine that they make a handsome profit out of this percentage, as a mileage approaching 250,000 has not yet put me into the doctor's hands. However that may be, I am broaching the subject of personal insurance because I have recently changed my own practice in this respect. I used to include my person in my machine policy. I discovered the other day that for a very trifling additional cost per annum I could insure myself handsomely against all kinds of accident and many forms of sickness, instead of merely against the road crashes which I never sustain. So now I take out two policies—one for the machine, and another of a comprehensive kind, not limited to motoring, for myself.

Finding Illegitimate Noises.

NOTHING is more fascinating than tracing unlawful sounds in a motor to their hidden lair, provided the tracking succeeds; and nothing is more irritating than being baffled by them. On my Scott, for example, I was recently subconscious of a squeak and a rattle. The squeak occurred when coasting with the engine off, but not when wheeling. I hunted for it "times," as they say in Devon, but without success; it disappeared when the rear chain got its fortnightly oilbath. The rattle was easier to track, for the pull-off coil spring of the kick-starter had weakened, and failed to keep the pedal up against its stop. Until a stiffer spring could be faked up, silence was earned by a bit of insulating tape on the stop and on that part of the chain stay most concerned. The resultant silence impressed a friend who had previously tried to stir my ire by terming the Scott a rattletrap, and who was now rather irked by illegitimate noises on his own 'bus. He demanded my assistance. We started out on the car and he bumped me over a rough road at fifty. My startled ears heard a noise suggestive of the glass in the windscreen grinding internally. We could not provoke this noise by any stationary tests, and needless to say that at fifty we could hear, but not trace it. I suggested he should drive her all out down a hill of 1 in 5, when the afflicted item would probably reveal itself by fracture. This remark was coolly received; yet if ever we envy the lordly car owner, let us rejoice that there are no body timbers secreted within a motor cycle. The second noise was worse. As he accelerated from the change up on to his top gear, a solitary but appalling mechanical thump was occasionally audible. It sounded for all the world as if one of the crank pins had gone down wallop to six o'clock, and found the lower half of its split bush missing. I surveyed his power unit: engine, clutch, gear box, dynamo, etc., all bolted up into a solid mass; advised him to dismantle it, and calliper each detail precisely; and then I fled for my life

Life's Little Worries.

ONE must not be hard on the trade in these worrying days. They are doing their best to fit us all out with roadworthy machines under conditions of unprecedented difficulty. So I tell the two following yarns in no captious spirit, but solely because of their intrinsic humour. Let it be supposed that Plantagenet de Vere is a motor cyclist of the gentlemanly type: a hard rider withal, but not of that kidney which enters the lounge at the Hotel Majestic with a smear of B.B. on his right temple and a miniature reproduction of the devastated Somme area on his oilskin trowtrows. P. de Vere takes delivery of his new two-stroke, unwitting that the foot brake is of the heel pedal variety, and that the heel is situate perilously near the revolving clutch boss of his countershaft two-speed gear. After a day with a sporting provincial club, he hobbles into the dining-room at the Hotel Titanic minus his left boot heel. Boots now cost about 90s. in Bond Street, where de Vere deals!

The shoe pinched our second hero in a different place. A diligent reader of *The Motor Cycle*, he had assimilated the benefit of the spring frame, and his latest mount was of that variety. Unfortunately, he selected for his patronage a firm afflicted with a designer who was a thought too sanguine. In fact, this designer was so utterly enamoured with the superb insulation afforded by his post-war spring frame that he dispensed with a saddle, and substituted a scarlet leather hassock of the pattern upon which one supposes Royalty to perform their orisons. For that purpose such hassocks may do well enow. But Major X. (that is neither his name nor rank) rashly entered for, let us say, the Exeter run, before he had sufficiently proved the new seating accommodation. Seeing him dismount—at Andover, would it not be?—a kindly constable thought to himself, "Another of our wounded heroes!" and proffered a ready arm. Major X. said ——. Had it been a beauteous maiden, in lieu of a burly constable, the designer might have been blessed instead of accursed.

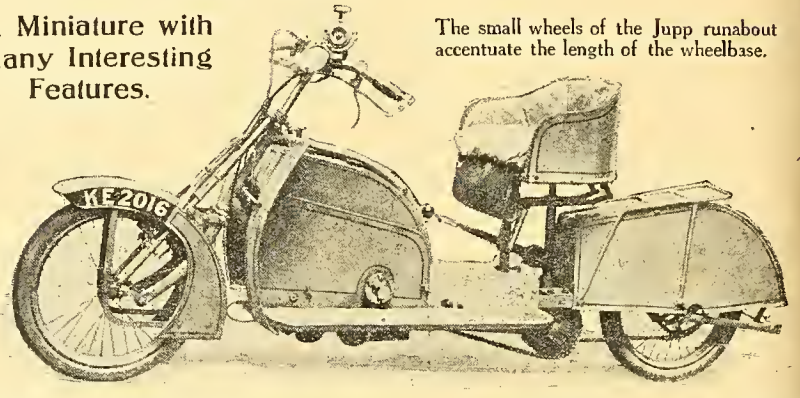
Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Roads Like Glass.

THE other night I had one of the nastiest rides in my whole experience, though it did not exceed ten miles in length. Heavy frost had converted wet roads into sheets of glass. What was worse, the surfaces were not uniform. On a southerly slope the road was still mushy in parts, except in shaded patches, where it might either be hard and safe or ice-filmed with moisture. Skidding and wheel-slip, super-added to intense cold, made this short expedition as lively as anybody could wish. When I arrived at my destination, I was mentally inventing knee and elbow pads, on the lines of an R.A.F. "crash" helmet; but, thanks to well-scolloped rubber tyres and a plentiful use of second gear, my machine never actually went over. It is under such circumstances that three or four wheels are so pleasant, because they permit of very slow speeds on surfaces where steering is something of a gamble. Some years ago an intrepid member of *The Autocar* staff took me for a 300 mile run over snowclad roads at Christmastide, and, though we had many anxious moments with his little car, we were never in danger of physical injury, as I certainly was a few nights ago. As I grow older, I sometimes pine for a monocar in wintertime; and so, I fancy, do other veterans. Moreover, a raging wind at zero temperature inspires dreams of a cosier seat than the saddle of a motor cycle: 'tis a naked perch in such weather. *En route* I passed an unfortunate stalled with a drowned charge in his acetylene generator. I told him that, in theory, I was the best of Good Samaritans, but that on such a night I would not take £1,000 to tow him home, and that my fingers were far too numb to play with his lamp. Luckily, a friendly car came along, and, being an ancient dug-out, it bore acetylene lamps, and was able to set him going again. Quite sensibly its occupants enquired why the Kaiser we were out in such weather on motor bicycles.

FROM SINGLE TO THREE TRACKS.

A. J. Dixon, a pre-war Singer exponent, re-entered the competitions field in the recent London-Exeter Run, when he drove a Coventry Premier runabout and obtained a gold medal.



Petroiling a Scott.

ONE of our readers, who dislikes watching one sight-feed on the road, found the twin glasses on the Scott somewhat of a strain, and consulted the makers as to the safety of mixing the oil with the petrol. They replied that they did not recommend the method because it is apt to be messy, but that it suits their engine perfectly, provided an occasional charge is given *via* the pump to lubricate the compression glands on the crankshaft. Consequently, my correspondent commenced experiments a month ago, putting half a pint of engine oil in each gallon of benzole and injecting half a pump every fifty miles through the pump to the glands. He is delighted with the results. As a cork-seated petrol tap is used on the Scott, and his Binks carburetter is more petrol-tight than some which I could name, he has only been troubled with greeny stains at one point of the machine, viz., the petrol tank stopper. He has not yet devised a really workmanlike dodge for curing this, but is content to wrap a piece of rag round the stopper. This bit of experience is useful in two ways. In the first place, it relieves the owner of what is rather a tedious job on the machine in question, viz., replenishing the frame tube reservoir with oil. In the second place, it shows up a petrol leak which probably exists on all Scotts, as on other machines fitted with similar tank stoppers, but which escapes notice till the fuel is coloured. Of course, this leakage only occurs when the tank is full.

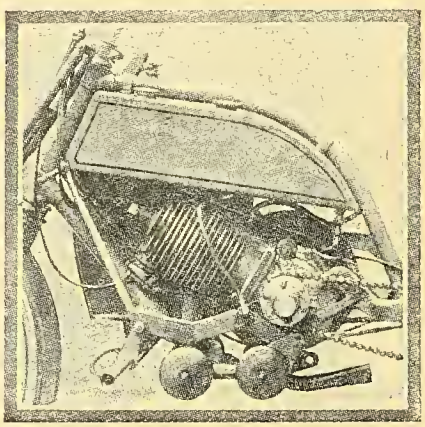
When adding the oil to the petrol, it it wise to mix it in the tin first, as, if poured into the tank, it tends to drop straight to the bottom.

A SINGLE-TRACK RUNABOUT.

A Miniature with Many Interesting Features.

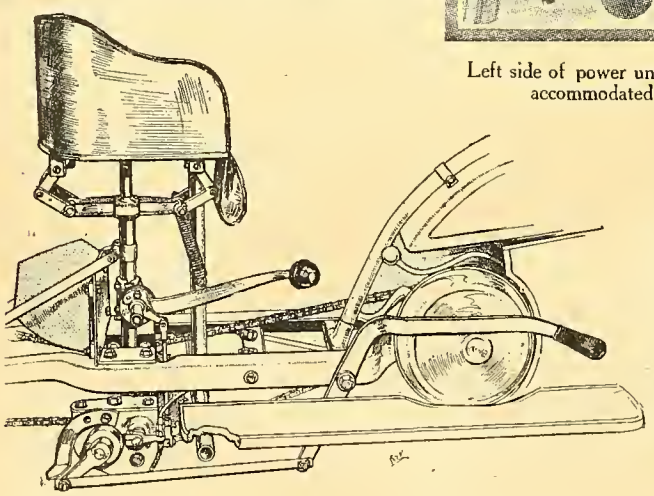
The small wheels of the Jupp runabout accentuate the length of the wheelbase.

HUNDREDS of our readers have asked for a lightweight motor cycle which will keep them clean on their pleasure trips or journeys to business. With a view to this special market, Mr. L. Jupp, of 165, Camden Road, Tunbridge Wells, has designed and constructed the interesting little vehicle described herewith.



When examining the illustrations, it should be remembered that the wheels are 18×2in., and that the whole machine weighs but 170 lb., in spite of its very complete guarding. With the exception of the frame and wheels, the specification is much the same as that of any high-class lightweight, and includes Villiers flywheel magneto two-stroke engine, Sturmey-Archer two-speed gear and clutch, and all-chain drive. The kick-starter, however, has been modified, and the engine is started by pulling up a long lever conveniently situated to the driver's right hand.

Both side members of the frame are of angle steel, the remainder of the frame being tubular in construction in the first models, though angle steel may be used throughout for production purposes.

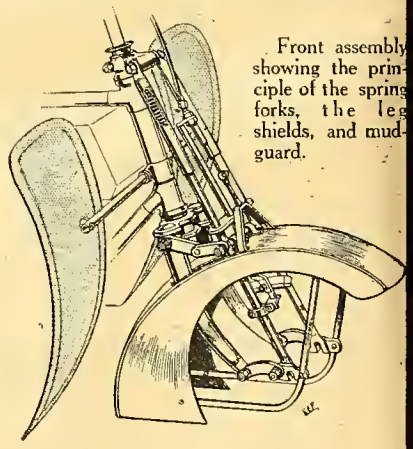


Spring Footboards and Seat.

Telescopic tube front forks are used, a coil spring being fitted within the top portion of each "girder" member; in addition, the footboards and the comfortable bucket seat are spring suspended.

At first sight it would appear that the engine and transmission are somewhat inaccessible, but we have seen the rear mudguard and carrier, the transmission housing, the engine housing, and leg shields removed in the space of two minutes, leaving all working parts exposed for inspection or adjustment.

Left side of power unit, showing how it is accommodated in the frame.



Details of the transmission and seat suspension. The lower lever is connected with what is normally the kick-start pedal. The small lever above the flywheel magneto operates the variable ignition

A large leather tool bag is suspended from the front of the bucket seat, the tank holds rather more than a gallon of petrol and a quart of oil, and a band brake on the rear wheel is assisted by a handle-bar-operated brake acting on the front wheel rim.

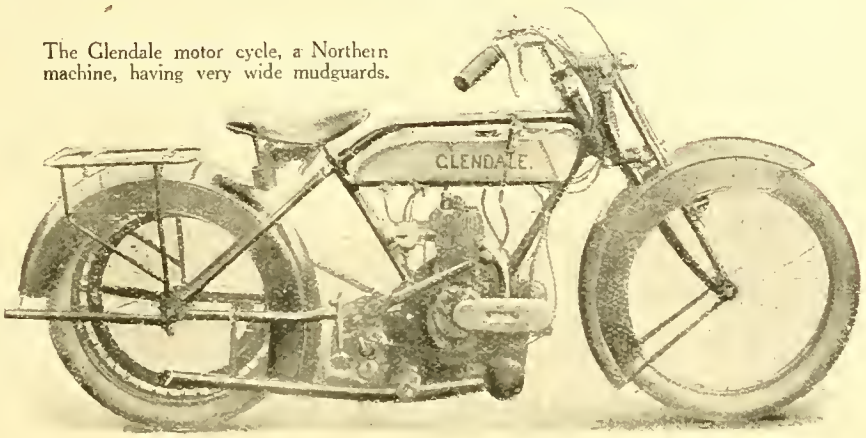
In spite of the fact that the machine we inspected was an experimental model, the guarding was well carried out, and should efficiently protect the rider from mud and oil.

Lightweight Motor Cycle Cost.

It is hoped that when manufacturing facilities have been arranged it will be possible to market this little runabout at a price in the neighbourhood of £80, so that it will compare favourably with existing lightweights as regards price, and will offer certain advantages which will appeal strongly to a large number of prospective purchasers.

Front assembly showing the principle of the spring forks, the leg shields, and mudguard.

FUN AT A SALE.



WE would have given a good deal to have been present at a sale recently held at Southsea, where a number of motor parts were put up for auction. Neither the man who printed the catalogue, the auctioneer, nor the majority of the buyers had the least idea of motor technical terms, and the specimen catalogue sent to us by a reader is a weird and wonderful production.

How the auctioneer persuaded his hearers to buy Lot 107, which was down in the catalogue as a "Split zioue," we cannot imagine; and we cannot understand any buyer being taken in by Lot 104, which was described as a "Millemum pulley deceiver." There are numerous other curios, such as Lots 127 ("Valcanised pulley"), 133 ("Crank, pum"), 136 ("Box addrents"), 142 ("One Sans-play"), 45 ("Commitator"), and 50 ("Gcle stand—back"). Other attractive lines were Lots 92 ("Two pistons 80 mm. and gudgeonpuns"), 93 ("Set trim tremble coils in case"), and 96 ("Polishing bot"). Our informant says that the parts had apparently been preserved since the day of the red flag, and were for the most part a collection of obsolete items.

A Dual Purpose Machine from the North.

Exceptionally Wide Mudguards Characterise the New Blackburne-engined Glendale.

A USEFUL double-purpose mount has lately been placed on the market by Messrs. Luke Atkinson and Son, Glendale Works, Wooler, Northumberland. It is constructed with a strongly built frame, Brampton Biflex forks, 26×2½in. wheels with flat base rims to which Bates' 26×2¾in. tyres are fitted. Very wide mudguards form a feature of this machine, being 6¾in. across with 3in. valances, and on those on the front guards the registration numbers are painted. Footrests are provided.

The Glendale motor cycle, a Northern machine, having very wide mudguards.

Large Tank Capacity.

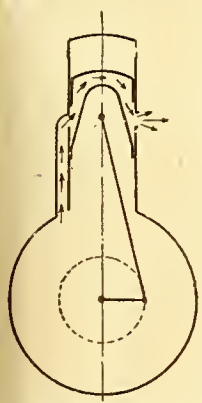
The tank is tapered from 12in. in front to 8in. at the rear, and carries one and threequarter gallons of petrol and three-quarters of a gallon of oil. The reason for this is that the makers have found by experience that it is often more difficult to get a particular brand of oil than it is of petrol, which can now be bought anywhere. This is a great convenience to the rider who purchases his oil in bulk.

The power unit is a 4 h.p. Blackburne engine driving by chain through a Sturmey-Archer three-speed gear box. The final drive is by belt. Silencing arrangements are attended to by a large silencer and long tail pipe. The machine is well equipped and appears to be a thoroughly up-to-date mount.

Cooling the Piston.

A Design which Utilises Crank Case Suction to Induce an Air Draught.

WHILE efforts to provide adequate cooling of the cylinders of modern air-cooled engines have been persistently kept in view, much less attention has been paid to the cooling of pistons. Nevertheless, in all probability, excessive heating of the latter is one of the most serious defects militating against the efficiency of many existing engines.



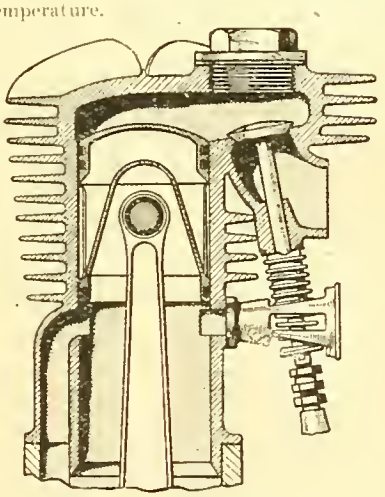


Diagram showing the path of the cooling draught on the under side of the piston.

With a view to eliminating any troubles arising from inadequate piston cooling, one of our readers, Mr. A. Freeman Sanders, of Pensford, near Bristol, has produced a design of four-stroke unit in which very thorough efforts are made to keep down the temperature of the internal working parts. The idea used is not altogether new, but the thorough way in which it is proposed to carry out the arrangement should tend towards a decided improvement in the running of air-cooled engines.

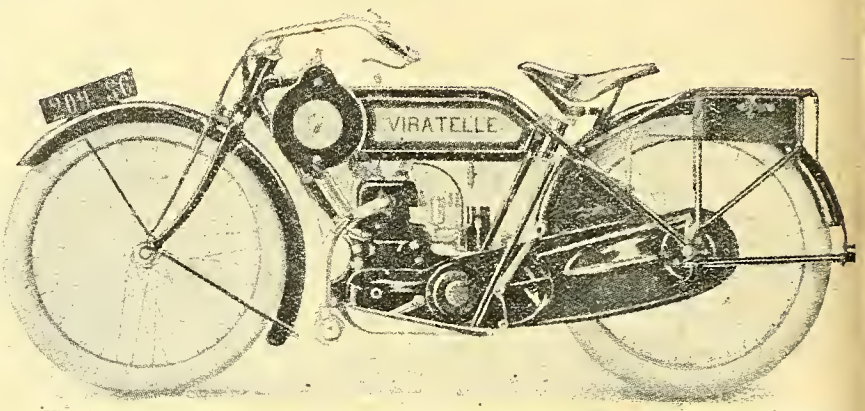
No Extra Parts Needed.

An explanatory diagram and a more complete section of a cylinder and piston render description almost unnecessary, but it will be seen that the piston has long slots at each side communicating with each other through a chamber formed by the piston top, and a "false roof" to the piston which clears the gudgeon pin bosses. The piston slots correspond with ports cut in the cylinder walls; these are opposite each other, one opening directly to the atmosphere, and the other communicating with the crank case by means of a duct in the cylinder casting. On the up stroke air is drawn through the ports and across the hollow head of the piston, into the crank case; on the down-stroke this air is pumped out again through the same passages.

By this arrangement cooling of the piston by an excess of oil should be unnecessary, as the continual flow of air under the hottest part of its crown should maintain it at a reasonable temperature.

The cylinder of a four-stroke engine designed to permit of cooling the piston

AN EXHIBITION IN THE EAST INDIES.



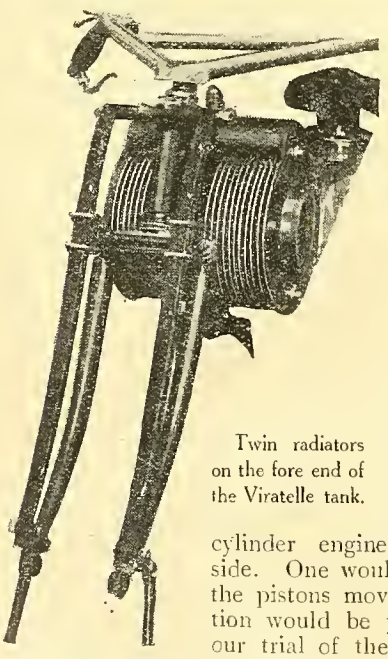
BRITISH manufacturers and exporters who seek to develop trade in the Netherlands East Indies—one of the most lucrative markets in the world, and one that is by no means over-supplied and over-developed—should be interested in the announcement that the Second Netherlands East Indies Fair is to be held at Bandoeng (Java) from September 19th to October 9th of this year. The Fair will be international in character, and will offer manufacturers an opportunity of exhibiting wares of all kinds to a vast number of potential buyers in the East. Everything that pertains to industry, commerce, and agriculture will be represented at the Fair, and a Motor Vehicle and Tractor Exhibition will be held simultaneously in the same town.

Preliminary arrangements are well forward, and a booklet setting forth all details, in English, is being prepared by the British Chamber of Commerce for the Netherlands East Indies, to whom, at 38, Dover Street, London, W.1, all enquiries in connection with this Fair and the concurrent Exhibition should be addressed. There is every prospect of the Fair being a great success.

BI

THE VIRATELLE ON THE ROAD.

A French Machine with "Side-by-side" Twin Engine and many Other Innovations.

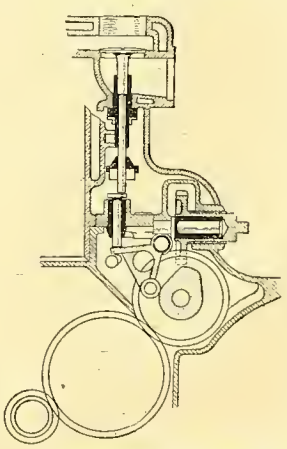


The 6 h.p. model of the Viratelle, which has two water-cooled cylinders side by side, having 73 mm. bore and 82 mm. stroke (686 c.c.)

SINCE our brief inspection of the Viratelle—an interesting machine of French origin (a description of which appeared in the issue of December 9th)—M. Viratelle, whose name it bears, gave us a demonstration of its road performance.

It may be recalled that the Viratelle is a water-cooled four-stroke machine, one model of which has two cylinders side-by-side; and as no similar motor cycle is on the British market its running was of particular interest. Probably the side-by-side twin is the neatest form of two-cylinder engine, and the reason why four-stroke engines of this type have not been more greatly favoured is on account of (1) the difficulty of balancing them if even impulse torque is obtained by arranging the cranks at 360°, and (2) the uneven firing torque if good mechanical balance is secured by using cranks at 180°.

We have had both types in the small car field, and excellent examples are still giving satisfactory service. The 8 h.p. Perry has the 360° crank arrangement, and the engines of the 7 h.p. Swift and 8 h.p. G.W.K. have cranks set at 180°. Owners of the first mentioned car will tell us that the vibration set up by the 360° setting is imperceptible, while Swift and G.W.K. enthusiasts state that there is no inconvenience or irritation accruing from the uneven firing, *i.e.*, two explosions in one revolution and none in the next.



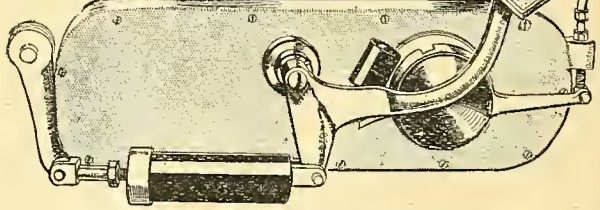
Twin radiators on the fore end of the Viratelle tank.

The two-cylinder Viratelle engine is of the Perry type, and is, therefore, artificially balanced, as, say, two single-cylinder engines placed side-by-side. One would suppose that, as the pistons move in unison, vibration would be present, but, after our trial of the French machine, we must admit that these theoretical objections are not so serious as is generally thought.

Unfortunately, a sidecar body was unavailable; consequently it was impossible to appreciate the comfort provided by the long laminated spring which supports the bearers of the Viratelle chassis.

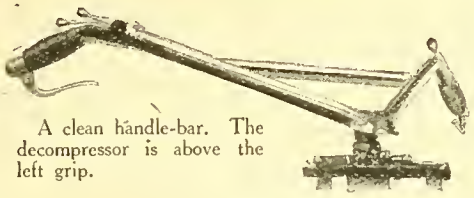
Perched on the carrier, however, which is incidentally abnormally wide, we were able to follow with interest the ease with which the machine is controlled.

Starting is effected by inserting a detachable handle, which is neatly clipped to the carrier stays, into a recess at the front end of the transmission case. The engine responded immediately to a half turn of the starter, and, with the first gear engaged, a touch of the clutch pedal, which, since the gear is of the epicyclic type, is actually a brake, set the machine in motion.



Valve gear of the two-cylinder Viratelle engine.

The transmission is smooth, whilst the silence of the engine was quite car-like. The gears are engaged by moving a small lever on the handle-bars, and it is possible to prepare a gear ratio long before it is required. To bring it into direct engagement, the clutch is operated.



Responsive Gear Changing.

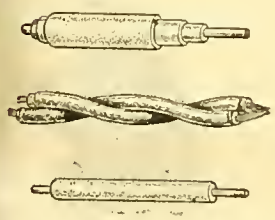
This scheme has a unique advantage, and would permit a change to a lower gear at the precise moment of advantage when ascending difficult gradients. The slow running of the engine is also worthy of note, and M. Viratelle demonstrated the working speed of his machine by keep-

The clutch pedal also actuates the carburetter control, and automatically throttles down when changing gear.

The Viratelle on the Road.— ing the front wheel within three inches of a slow moving vehicle. The efficiency of the radiator requires no comment, and the cylinders kept remarkably cool. The 3 h.p. single-cylinder model runs quite as well as the big machine, and hauls a light sidecar with ease.

A clean handle-bar. The decompressor is above the left grip.

It is hoped that these machines may have an opportunity of figuring in some open competitions, when their performance under difficult conditions would excite much interest.



ELECTRIC WIRING FOR MOTOR CYCLES.

A Review of Various Types of Cables Suitable for Lighting Sets.

ELECTRIC lighting has become so popular with motor cyclists that the details of such equipment are now an important subject. With electricity a little knowledge is dangerous, and not a few amateur mechanics have invited trouble in installing electric lighting on the experience gained from tinkering with electric bell wires.

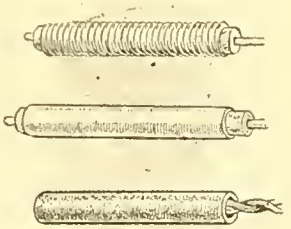
A little consideration will show that if an electrical installation is to be a success, it must be carried out in the proper manner, and, in this connection, there is a no more important point than the wiring.

There are two principal troubles to be feared with the wiring of motor vehicles generally; what electrical men call "shorts," and disconnections. Shorts are generally far the more serious: they may lead to serious damage to the dynamo, to the running down of the battery, and possibly to other troubles. Disconnections only lead to the loss of current to the apparatus supplied by the wire in which the break occurs. By a "short" is meant a short path for the current from one wire to the other with double wiring, from the wire to the frame of the machine with single wiring; in either case, the electrical resistance of the apparatus the current is to supply is cut out of the circuit by the short, and the pressure has very little resistance opposed to it, and delivers a very powerful current through the conductors remaining in the circuit in consequence. As the heat delivered to the conductor by the current increases as the square of its strength, the possibilities of trouble will be appreciated.

Types of electric wires suitable for motor cycles. (Top) Concentric. (Centre) Twin. (Bottom) Single.

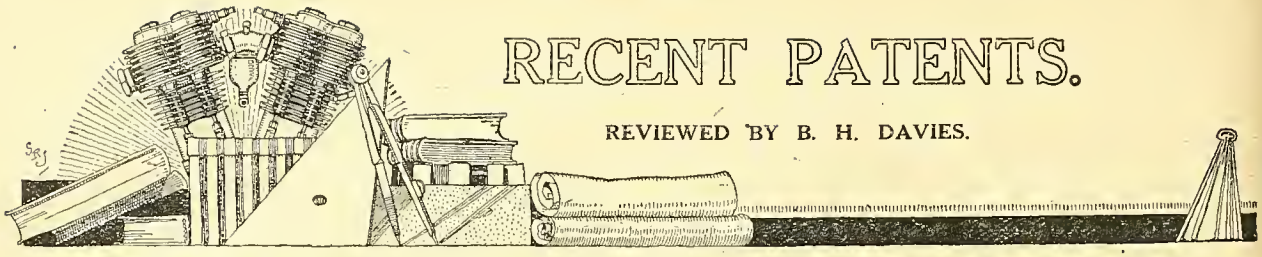
Forms of Wire Available.

There are three kinds of wire available for motor vehicles; twin wire, single insulated wire, and concentric wire. By concentric wire is meant a single wire, insulated in the usual way, with a second conductor forming the return, outside of the insulation, the outer conductor being concentric with the inner one. The outer conductor may be insulated, or may be allowed to make as much "earth" as it can.



Twin wire consists of two conductors each carefully insulated, the two being enclosed in some kind of protecting envelope. Its advantage is that it requires two earth faults, two connections to the frame of the machine, or one connection between the two wires themselves, to form a short circuit; usually shorts with twin wire are due to separate connections to the frame of the machine, one on each wire. The disadvantage is, the wiring is more complicated, two wires have to be taken everywhere, and the twin wire is usually not as well protected from mechanical injury, and from grease, etc., as the single wire. There is usually greater danger of a connection occurring between the two wires.

With the single wire, one side of the battery, and one side of the dynamo, are connected to earth, the frame of the machine; and one wire is led from the battery and dynamo to everywhere that current is wanted, switches being interposed for control; it has the advantage of simplicity; one wire only is required to be taken everywhere, and that is a great convenience in itself, especially for lamps. It is much easier to protect the single wire from mechanical injury, and from oil, grease, etc.

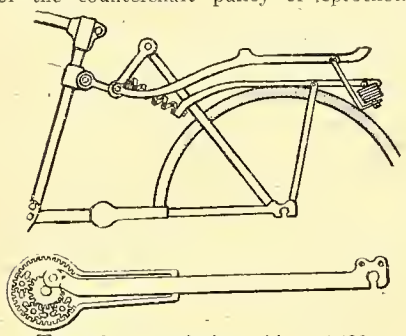


Concentric wire is a late introduction. The present writer is not enthusiastic about it. Special fittings are required with lamps, etc., where it is used, and in his view, shorts are more liable to occur through direct connection between the inner and outer conductor.

Protection of the Wires.

The protection of the wires, and their insulation, is really the crux of the whole thing. Wires should be made strong, and flexible; half the troubles with wiring outfits are due to the wires themselves being too small; the present writer would not use a smaller gauge than No. 16, or its equivalent, anywhere. Next, the protection of the insulation; there are three methods possible, armouring, drawing into lead tubes, and covering with cab tyre sheathing. The writer very much prefers the last. Lead tubes for protecting wires are formed over the insulated wire, and can be made very flexible, and not at all liable to crack. A wiring outfit with wires equivalent to No. 16 gauge, insulated with a good thick envelope of vulcanised rubber, the rubber protected by braid, and the whole drawn into a modern lead tube, should answer well, and give very little trouble; but the same wire protected with cab tyre sheathing, which stands mechanical injury, as well as oil, etc., is even better and cheaper. S.F.W.

Methods of protecting the insulation. (Top) Armour. (Centre) Lead tube. (Bottom) Cab tyre sheathing.

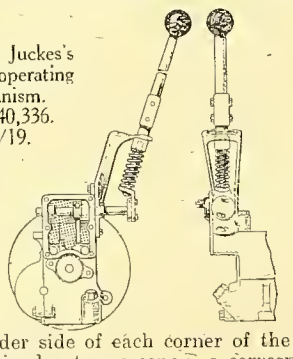


RECENT PATENTS.

REVIEWED BY B. H. DAVIES.

Compensating Gears for Springing.

ONE of the minor troubles encountered in developing a spring frame is to keep the final drive—whether chain or belt—at the correct tension. It is almost impossible to make the hinge pin of the rear frame coincide with the centre of the countershaft pulley or sprocket.

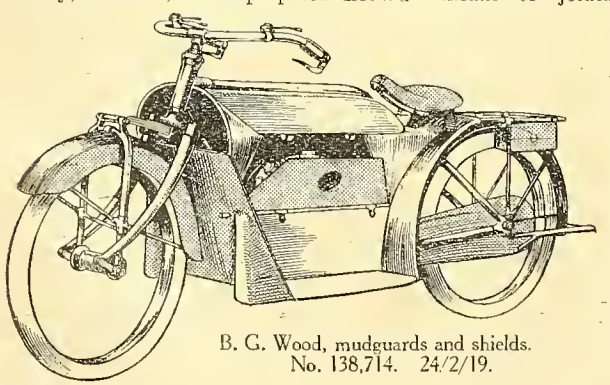


Tranter's rear springing. No. 145,292. 5/8/19.

Most designers put up with a compromise, and in some cases no ill effects are perceptible on the road. But it is not unknown for the belt on such frames to slip more than it should, or to snap its fastener or pull through a belt screw oftener than would occur with a correct design; whilst on one well-known chain-driver it is wise to put a heavy rider in the saddle before adjusting the rear chain. Messrs. Tranter and Brookes have evolved the arrangement shown herewith to correct these evil tendencies. They introduce compensating gears in the hinge of the chain stays, whereby the path of the wheel spindle is kept at a true radius from the centre of the countershaft pulley or sprocket. This invention effects its purpose, but fails to do so with that simplicity which is at once the hallmark of genius and the secret of commercial success. The weight, complication, and manufacturing cost of the apparatus are too great to justify its adoption. Noteworthy, however, is the proposed method of springing the carrier, which is pivoted at the front to the frame, and suspended at the rear on coil springs from the wheel member.

Four-speed Gate Control.

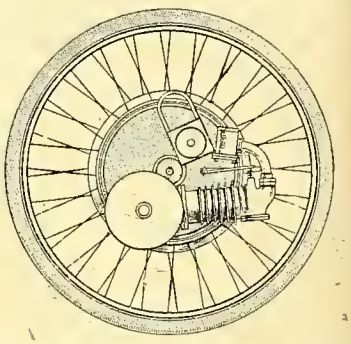
Mr. T. C. Juckes protects a neat type of four-speed gear change. In general outline it is of the ordinary gate pattern. The special features are its adjustability for angle of the lever, and the method of locking the lever in each corner of the gate. The gate bracket is slotted for attachment to bolts on the gear box, and the foot of the lever is also slotted for attachment by bolts to the end of the rod which controls the selector mechanism. It is thus possible to swing the lever through an arc depending on the length of the slots; and the rider can thus set his gear control to suit his reach; or to clear any fittings which he may desire to mount on the machine.



T. C. Juckes's gear-operating mechanism. No. 140,336. 13/10/19.

The under side of each corner of the gate is machined out as a cone; a corresponding spring operated cone slides on the gear lever. Thus the lever is freed whenever its knob is depressed, and locked when the knob is released. A separate spring trigger lock is, of course, provided on each selector position inside the gear box.

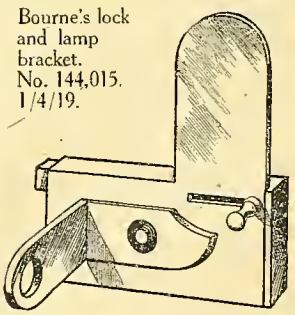
Cowling and Weatherproofing.



Mr. B. G. Wood is interested in the cowling of an air-cooled engine. By means of joining the footboards into an undershield, adding detachable side covers, fitting a wide front splasher, etc., he boxes the engine in, and provides a wide funnel mouth bisected by the steering head. The draught enters the cowl through the opening, and may be concentrated on the cylinders with the aid of any suitable interior baffles. It is doubtful whether this construction would be satisfactory without a forced draught.

B. G. Wood, mudguards and shields. No. 138,714. 24/2/19.

Motorising the Pedal Cycle.

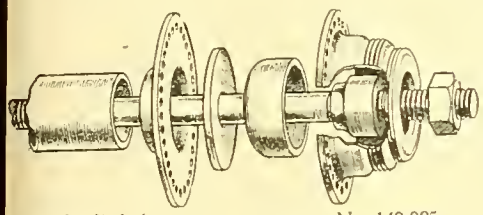


Mr. E. F. Eveleigh is out to motorise push bicycles without any structural alterations. He uses a fixed spindle for the rear wheel, and at one end of the spindle he mounts a fixed disc on which the engine, magneto, etc., are carried, thus avoiding any reconstruction of the rear frame, such as would be necessary if a fat motor wheel were employed. The road wheel consists of a hub of large diameter secured by wire spokes to the tyre rim, and is driven through a clutch and internally toothed gear wheel by a small pinion on to the crankshaft. The device appears to be quite practicable, though neither its weight nor cost could be very low.

Eveleigh's motorised cycle. No. 144,008 27/3/19.

Combined Lock and Lamp Bracket.

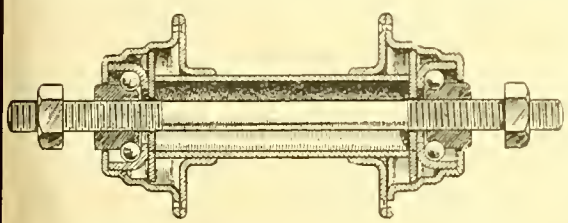
Messrs. Bourne and Bourne propose to safeguard a cycle—motor or otherwise—against theft by means of a spring-operated bolt, which is controlled by a lock and key, and can be fixed so as to protrude between the spokes of the back wheel. A bracket for carrying the tail lamp may be included in the gadget. I am all in favour of a thiefproof device which does not have to be carried loose in the pocket. At the same time, I am always a little nervous about using one



Bourne's lock and lamp bracket. No. 144,015. 1/4/19.

ecent Patents.—

hich does in a few spokes if some clumsy iot pushes the machine a foot or so. e need security against fools as well as gainst rogues.

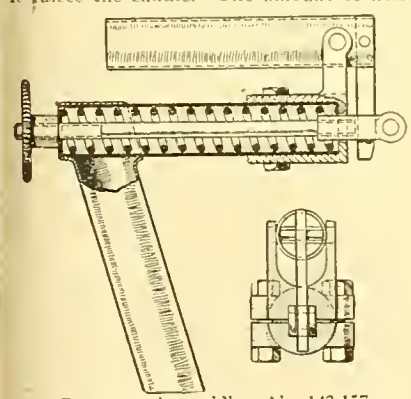


Hubs from Stampings.

M. L. A. Berland's invention is chiefly interest to manufacturers, being esigned to cheapen the production f hubs. His idea is to use three stamp-

Berland's hub—component parts. No. 140,895.

ngs for the parts composing the business nd of a hub, as shown in the sketch, and o weld them in position on the end of he plain tube which composes the shell f the hub. No machining would be ecessary, except perhaps on the faces of

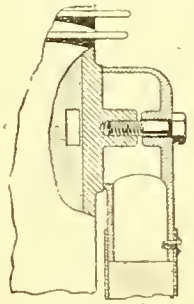


Berland's hub in section. No. 140,895. 19/3/19.

the bearing cups and on the outside of the end caps. I am not a hub manufacturer, but I wonder whether the heat of welding would affect the temper of the steel used for the bearing cups.

Saddle Springing.

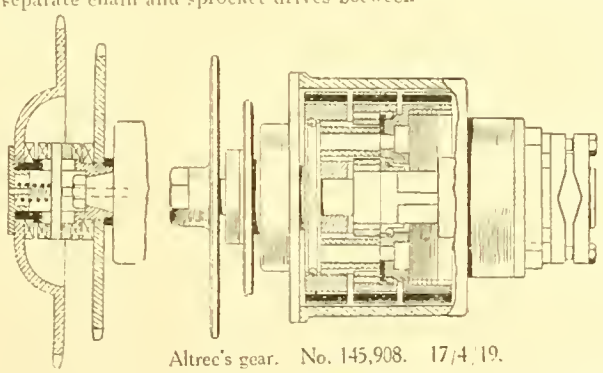
The construction of Messrs. Burgess and Winter's saddle mounting is obvious from the sketch. The horizontal tube of the ordinary saddle-pillar is utilised to contain an adjustable coiled spring, the saddle being mounted above this tube on a pivot. The obvious defect of the device is that it raises the saddle. The amount of hoist



Burgess spring saddle. No. 143,157. 17/12/19.

shown in the drawing is not more than 2in., but for motor cycling over modern pot-holes, or for the jump mount, the saddle would have to be raised considerably more than this amount.

Exhaust Pipe Fixing.

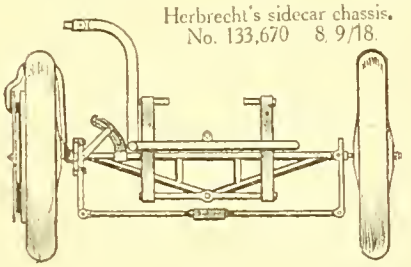


Messrs. George and Bircumshaw, like all the rest of us, have evidently wasted some time in wrestling with unsatisfactory exhaust pipe fixings. As the sketch shows, they give their preference to a stud screwing into a boss on the cylinder walls and clamping a cowl on the end of the pipe. The system certainly renders the pipe easy to fix or detach. It may be a little apt to shake loose, and a little difficult to safeguard against leaks. It probably will not make a hotter spot on the cylinder wall than rival methods.

George's exhaust pipe fixing. No. 144,494. 12/7/19.

Countershaft Epicyclic Gears.

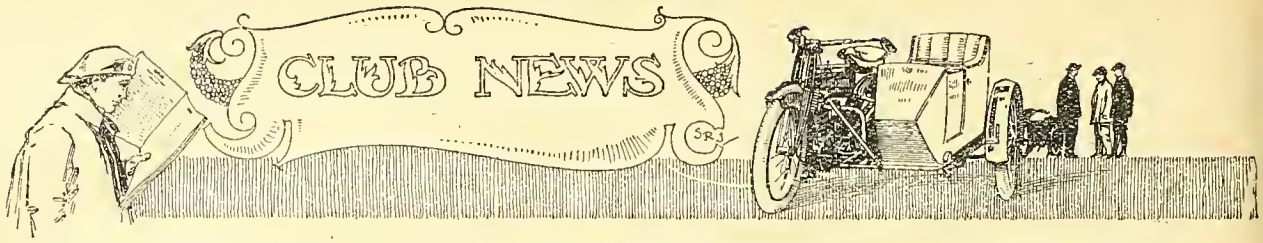
Mr. A. Alltree's name is probably unfamiliar to the majority of our readers, but his brain is responsible for more than one popular gear box, and any new ideas of his on the subject of transmission command our respectful attention. There are two points of quite special interest in his present set of patents which cover a good deal of ground without betraying exactly what final pattern some firm of manufacturers presumably intend to market. The first novelty is that he proposes to adapt the epicyclic type of gear box for countershaft use, and to supply either three or four ratios. The second is that he also covers the use of two separate chain and sprocket drives between



Altrec's gear. No. 145,908. 17/4/19.

the engine and the gear box, coupling up either of them by means of a dog clutch, as was done on the A.J.S. machine which won the 1920 T.T. The sketches explain the technical details. The control policy is to use a plate clutch with a neat concentric cam action and to fit a gate for the gear controls. A more convenient or foolproof policy could hardly be imagined, and the clumsiest beginner will experience no difficulty in handling such a transmission at sight. On the other hand, unless the double primary chains are included merely for racing stunts, it is difficult to see how they can be justified. When two chains share a common adjustment they worry a skilled rider and often baffle a novice. Under Mr. Alltree's design four ratios can be provided in a reasonable space at a moderate weight, and at no very great cost, all quite weighty considerations.

Flexible Sidecars.



The maintenance of the sidecar wheel in a vertical plane at right angles to the axle became standard practice long ago, although many experiments were made with side wheels (to mention only the Montgomery flexible and Millford caster wheel types) which moved in some way in sympathy with the steering or inclination of the machine when cornering. Now, however, M. Louis Herbrecht, of Belfort, proposes a modified edition of the pattern in which the motor cycle wheel is linked to the sidecar wheel by a tubular framing which takes the form of a vertical parallelogram jointed at the corners. This construction enables each rear wheel to bob up

Herbrecht's sidecar chassis. No. 133,670 8/9/18.

and down independently when the machine is travelling in a straight line. In rounding corners the side wheel tilts in unison with the driving wheel. M. Herbrecht's arrangement differs from previous constructions in that the upper edge of the parallelogram is in line with the wheel axles, which improves the stability. The practical drawback of this flexible construction is that the combination lacks what an airman would call "automatic stability" when the outfit is stationary. M. Herbrecht prevents his outfit from wilting sideways when stationary by providing a locking arm working in a sector, as shown at the left of the sketch. He suggests a nut and spanner, but such a clumsy expedient would be fatal to the commercial success of his sidecar. If his drawing is to scale, the slot in his sector permits a rocking action of about 75°. It is just possible that he may find a limited market if he fits stops reducing the rock to 30°, or if he provides a lever lock for use in stoppages. But I doubt the success of the system under any circumstances, for the rigid sidecar has proved quite acceptable to the public. I should add that the lower ends of the C springs are secured to a horizontal lever which is centrally pivoted, so that the sidecar hangs vertical when the frame tilts. The success of the flexible sidecar in America cannot be denied; and at least two firms in this country make what might be termed the "semi-flexible" type.

B.

Mexborough and District M.C.C.

A club has been formed at Mexborough under the above name; and we are requested to call the attention of local motor cyclists thereto. The annual subscription is 10s. 6d., and the secretary is Mr. C. Smith, 52, Main Street, Mexborough.

Stockport M.C.

The Stockport Motor Club held its general meeting on January 11th at the White Lion Hotel, Stockport, at which the president, Mr. H. Marsden; the treasurer, Mr. H. Greenhalgh; and Mr. E. S. Abram, secretary, were unanimously re-elected. The secretary's report was of a very satisfactory nature, the membership of the club having increased from 40 to 170. A very energetic programme has been arranged for 1921.

Surrey M.C.C.

The annual general meeting took place at the White Horse Hotel, Guildford, on January 19th. The report and balance sheet showed a satisfactory position; but, in view of the increasing costs, it was decided to raise the annual subscription from 10s. 6d. to 15s., plus any increase in affiliation fees.

A supper will be held at Ripley on Wednesday, February 16th, and the annual dinner will take place at Guildford on Saturday, March 12th.

North London M.C.C.

An exceptionally enjoyable evening was spent on January 21st, at The Refectory, Golders Green, when a social evening and whist drive was held. Mr. J. F. Hull, who is a vice-president of the club, was present, and kindly presented the prizes to the successful competitors. It is hoped in view of the success of this evening to secure a record attendance at the club concert which has been fixed for February 12th. Full particulars can be obtained from the secretary, Mr. A. W. Day, Lynton, Park Crescent, N.3.

Birmingham M.C.C.

With Mr. Lycett in the chair, about 130 members and friends of the Birmingham M.C.C. enjoyed an excellent dinner and musical programme on Friday, the 21st inst. During the evening 163 awards were distributed, no fewer than 127 going to members of the club. In addition, Mr. Egginton (hon. sec.) and Mrs. Egginton received handsome mementos subscribed by the club in recognition of their excellent work on the club's behalf. The Birmingham M.C.C. was founded in 1903, and, with a membership of well over 300, claims to be one of the oldest and largest motor cycle clubs in the world. There were many well-known figures in the motor cycle world present on this occasion, and the dinner, held at the Midland Hotel, Birmingham, was voted a great success.

Rochester, Chatham, and District M.C.

A general meeting of this club will be held on Tuesday, February 8th, at 8 p.m. at the Royal Crown Hotel, Rochester. It is requested that all members interested in the future of the club should attend.

Oxford University M.C.C.

At a general meeting of the Oxford University M.C.C. held on January 18th, the following new officers were elected: Hon. sec., Mr. I. P. Riddoch, 58, Holywell, Oxford; hon. treas., Mr. F. P. D. Scott, Balliol College, Oxford.

A hill-climb between the Oxford and Cambridge University M.C. Clubs will take place on March 6th, or, if wet, on March 13th, on Aston Hill, near Tring.

Purley and District M.C.C.

An extraordinary general meeting of the Purley and District M.C.C. will be held on February 23rd at the Railway Hotel, Purley, at 8 p.m. The club, which was founded in 1907, has an excellent programme for 1921. Enquiries from prospective new members are invited. The hon. secretary is Mr. A. O. Gruzelier, 93, Foxley Lane, Purley.

Plymouth and District M.C. and L.C.C.

The Plymouth and District M.C. and L.C.C. is anxious to organise an inter-club trial for West Country clubs in 1921 and a general meeting of motor cyclists. Mr. S. L. Snell, sports hon. secretary, 97, Old Town Road, Plymouth, will be glad to get into communication with secretaries of clubs who are likely to be interested.

Leeds Motor Union.

The annual dinner of the Leeds Motor Union took place recently at the Victory Hotel, Leeds, when 146 members attended, Mr. E. H. Hepper (president) presiding. After dinner, the usual toasts were given, these being interspersed by musical items of a very high quality. Mrs. E. H. Hepper presented the prizes, amongst which were the Mitchell Trophy and the Great North Cup, and, in addition, about fifty medals.

Wallington and District M.C. and L.C.C.

This club held its opening run on January 22nd to Burford Bridge, when twenty-eight members were present. The club flag, which is black and white check, aroused a great deal of interest on the road. Particulars of the club may be obtained from the secretary, Mr. C. M. Bowen, The Chalet, Woodcote Avenue, Wallington, Surrey.

A comprehensive programme has been drawn up for 1921, and for February there is to be a fancy dress dance on the 19th, and a social run on the 27th. It is hoped that there will be large attendances.

North Wales M.C.C.

Established about twelve months ago, the North Wales M.C.C. held its first annual dinner and distribution of prizes at the Bull Hotel, Denbigh, on January 18th. The club has now a membership roll of between eighty and one hundred, of which seventy, including several ladies, attended. Mr. William Edwards, who initiated the club, presided, and was supported in the vice chair by Mr. Sidney Watkins. The meeting proved a thorough success. A programme of music had been provided, which was much enjoyed.

Wolverhampton M.C.C.

At the headquarters, the Talbot Hotel, on the 17th inst., the above club held its annual dinner, which was attended by about seventy members, including the president, Sir Alfred Bird. An excellent concert followed the dinner, the songs and music being well received. In a very witty and suitable speech, Sir Alfred touched on the fame of the club in the world of motor cycling, several national events last year being won by the members, chief among which should be mentioned the Tourist Trophy Races in the Isle of Man.

Western Centre A.C.U.

Preparations for the open two days trial, to be held on April 8th and 9th, are now well in hand, and forty applications for entry forms have been received. A number of officials are required to carry the trial through successfully, and an appeal is made to secretaries of affiliated clubs to render all the assistance they can. The hon. trials secretary's address is St. Moritz, Wyche Road, Malvern. It is anticipated that there will be a large entry from manufacturers and private riders, while other centres are invited to nominate centre teams of three riders to compete for a special award. There are prizes also for manufacturers' teams and for teams from clubs within the centre.

The next board meeting of the Centre will be held at Bath on February 19th.

Newcastle and District M.C.

About 100 members attended the annual meeting of the Newcastle and District Motor Club held at the Grand Hotel on January 21st, when Mr. Fred Keir presided. Sir Arthur Sutherland was elected as president, and it was intimated that he would present a president's cup for competition. A friendly arrangement between Sunderland M.C. and the club was outlined by the chairman, under which, for a 3s. capitation fee, Sunderland members are to be admitted to the Newcastle competitions. Messrs. S. Bell and W. Chase were elected as secretaries, and Mr. W. R. Lister as treasurer.

The Balance of Motor Cycle Engines.

Some Informative Notes on Improving the Balance of Existing Engines.

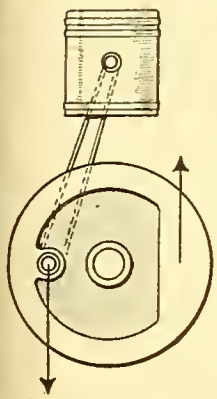


Fig. 1.—Here the whole of the reciprocating masses are moving at the same speed as the crank pin.

THE necessity of balancing arises from the old and obvious principle of action and reaction: whenever force is exerted on an object, causing it to move, an equal force is exerted in the opposite direction.

For example, when a man pushes a cart forward, his feet are all the time tending to push the earth backwards; when the exploding gas pushes down the piston of an engine, there is an equal force tending to push up the cylinder; when the engine pulls round the chain, there is an equal pull tending to twist the engine in the frame; and so forth. Now in the case of an engine there are certain parts which we wish to move, while we desire the body of the engine as a whole to keep still. But, as just explained, for every motion of the moving parts, there is a tendency towards a reverse movement of the "stationary" parts. The difficulty can be got over by arranging the moving parts in pairs, so that for any one considered there is an equal one moving in the opposite direction. But this is not always practicable, so some compromise has to be arranged; and in the design of this compromise lies the science of balancing.

A Simple Explanation of a Common Difficulty.

The best modern engines are exactly balanced by their makers; but many owners of older machines could improve their running by a slight alteration.

As a general rule, articles on balancing confine themselves to the ideal engine with connecting rods of infinite length, with the result that the conclusions arrived at are appreciably incorrect.

In this article an attempt is made to set out the ACTUAL conditions of balancing in a simple manner, together with hints on carrying out the alteration in practice.

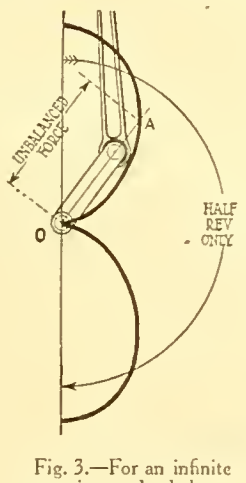

Fig. 3.—For an infinite connecting rod: balance weights equal to rotating masses only.

The distance from the centre to the curved line (OA) indicates the amount of unbalanced force. For any other position of the crank draw centre-line and measure from where it cuts the curve. In this case the maximum force is 58 units.

Fig. 4.—For a connecting rod of 1¾ times the stroke: balance weights equal to rotating masses only.

The light line shows the curve of fig. 3 (infinite connecting rod) for comparison. The maximum force is here 73 units.

Taking first the case of a single-cylinder engine, there are three types of motion to be balanced: the crank-pin and connecting rod big end moving in a circle; the piston and small end in a straight line; and the rest of the connecting rod the motion of which varies along its length, but is always of oval form.

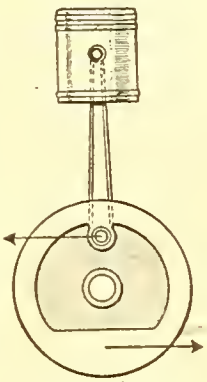

Fig. 2.—In this position the piston is stationary: only the lower end of the connecting rod is moving.

The circular motion is easily balanced by giving the flywheels excess weight on the side opposite to the crank-pin, the excess weight being equal to that of the crank-pin and big end, and at an equal distance from the centre. But the straight line movement of the piston can only be *completely* balanced by a similar straight line motion. As, however, this would entail complication — practically a second (dummy) cylinder, etc.— the piston etc., is usually partially balanced by increasing the excess weight on the flywheel.

Lastly, the oval motion of the shank of the connecting rod is usually balanced by considering it in two parts: we deal with it as if part of the rod moved straight up and down with the piston and the remainder revolved with the crank-pin. If the right proportions are chosen for the two parts, no error is introduced.

Now comes the important question: what should be the weight of the "bob-weight" or "balance-weight" to be added to the fly-

The Balance of Motor Cycle Engines.—

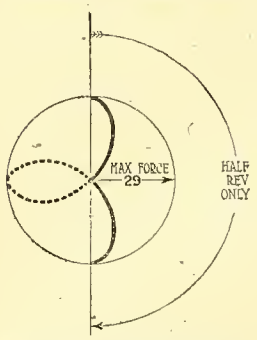

Fig 5.—Showing the effect of adding extra balance weights to an engine with infinite connecting rod. In this case the balance-weights are equal to half the reciprocating masses as well as the rotating. The maximum force is reduced to 29. The dotted part of the curve represents a *push* on the crank instead of a pull.

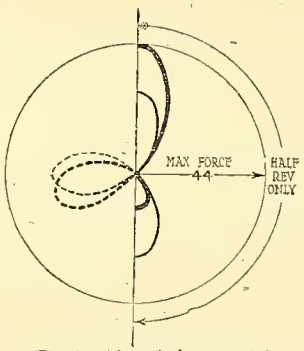

Fig. 6.—Here, balance weights, as in fig. 5, have been added to an engine with connecting rod of $1\frac{3}{4}$ times the stroke.

The maximum force is 44 units. The curve of fig. 5 is repeated for comparison.

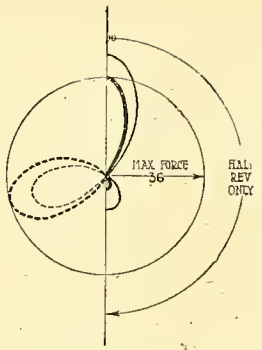

Fig. 7.—Balance weights increased from $\frac{1}{2}$ to ·65 of the reciprocating masses improve an engine with short connecting rod ($1\frac{3}{4}$ times the stroke), reducing the maximum force to 36 units. The curve of fig. 6 is repeated for comparison.

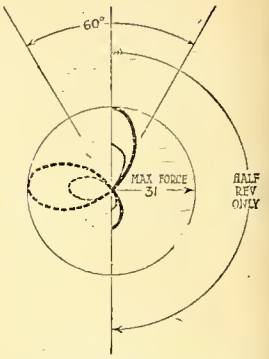

Fig. 8.—60° twin engine, connecting rod $1\frac{3}{4}$ times stroke, balance weights equal to rotating + ·54 of total reciprocating weight.

Heavy curve, bore and stroke, same as single already considered; maximum force 31.

Light curve, total c.c. same as previous single; maximum force $15\frac{1}{2}$.

wheel? Looking at fig. 1, we see that the whole of the piston, rod, and crank-pin are moving downwards. One would, therefore, be inclined to add a balance weight of equal amount. But now compare fig. 2. Here we see that the only parts actually moving are the crank-pin and that part of the rod that we have agreed to include with the pin, the piston being stationary for this instant.

Diagrams of Unbalanced Force.

Obviously, the same balance weight cannot suit both cases, so, again compromising, we make the weight equal to the crank-pin and "rotating part" of the rod (which are together known as the "rotating masses") and then add part only of the weight of the piston and the other part of the rod (known as the "reciprocating masses.") It is frequently stated that one-half of the reciprocating parts should be balanced: but this is derived from calculations on the basis of a connecting rod of infinite length. In actual practice, the fact that the rod is of finite length, and usually short at that, exerts a much greater influence than is usually supposed.

In the following diagrams an attempt has been made to show its effects. All these balance diagrams are to be read in the same way.

In fig. 3, for example, the crank has been shown. If its centre-line is prolonged to cut the curve, the length OA represents the out-of-balance force pulling on the crankshaft bearings, and hence tending to shift the engine in the frame, and thus causing vibration. For any crank position to the right of the centre-line the force is found in the same way. The forces for crank positions on the left of the centre-line are exactly similar, and are omitted to keep the diagram as simple as possible.

Shortness of Connecting Rod.

Fig. 4 shows the effect of a short connecting rod. Rods in use on petrol engines vary between one and threequarter times and two and a quarter times the engine stroke, and the force curve in this instance has been drawn out for a rod equal to one and threequarter times the stroke. The force for an infinite connecting rod has been repeated for comparison. It will be seen that the unbalanced force is now much greater at top dead centre than at bottom, and that instead of being zero at half the stroke, this ocurs some time before (actually at about 75°). These facts have most important effects, especially when dealing with twin engines.

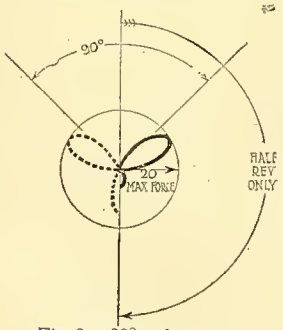

Fig. 9.—90° twin, connecting rod of $1\frac{3}{4}$ times stroke, balance weights equal to rotating + ·53 of total reciprocating masses.

Maximum force 20 units.

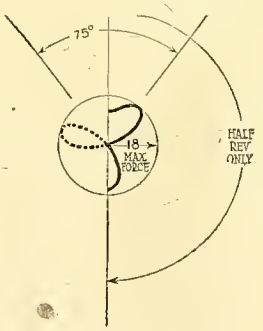

Fig. 10.—75° twin, connecting rod of $1\frac{3}{4}$ times stroke, balance weights equal rotating + ·48 of total reciprocating masses.

Maximum force 18 units.

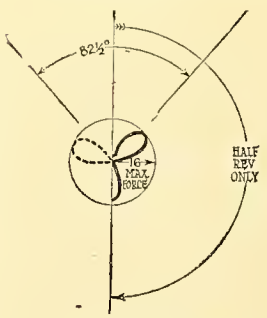

Fig. 11.—$82\frac{1}{2}$° twin, connecting rod of twice the stroke, balance weights equal rotating + ·5 total reciprocating masses.

Maximum force 16 units.

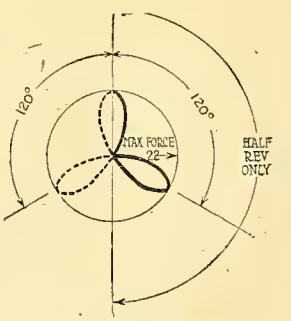

Fig. 12.—Three-cylinder radial, total capacity equal to twins already dealt with. Connecting rods of $1\frac{3}{4}$ times stroke, balance weights equal to rotating + ·52 of reciprocating masses.

The Balance of Motor Cycle Engines.—

In both the last cases, the forces are shown as entirely unbalanced, *i.e.*, the bob-weights are equal to the rotating masses only. Fig. 5 shows the effect of adding to the imaginary engine, with infinite connecting rod, bob-weights equal to half the reciprocating masses as well. The dotted part of this curve, to the left of the centre-line, represents the period during which the force due to the bob-weight is greater than that of the piston, etc. During this time, the force on the bearings is a pressure *away* from the crank. It will be noted that the greatest "negative" force (*i.e.*, *away from* the crank) is equal to the greatest positive; that they both have maximum values of twenty-nine units instead of forty-seven, as in fig. 3; and that there are now four small kicks per revolution instead of the two large ones—a great improvement.

Fig. 6 shows the corresponding state of affairs in a practical engine with short connecting rod, the curve of fig. 5 being reproduced for comparison.

It will be seen that the shortness of the connecting rod has raised the maximum force to forty-four units; but the maximum negative force due to the bob-weight is only twenty-eight units. Hence, as shown in fig. 7, the balance can be improved by increasing the bob-weights, when the maximum force is thirty-six units, the bob-weights being nearly two-thirds of the reciprocating weights (actually 0.65).

This is one quite important fact: the correct balancing of an engine *depends on the connecting rod length*. Further on are given some practical hints on the subject.

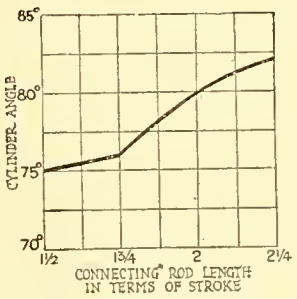

Fig. 13.—Showing the angle between cylinders which gives the best balance for various lengths of connecting rod.

As the calculations needed for this and fig. 15 are exceedingly laborious, part of the work has been done graphically. Accordingly, the accuracy of the results is not greater than about 2%, or 1 in 50. This, however, is amply sufficient for practical purposes.

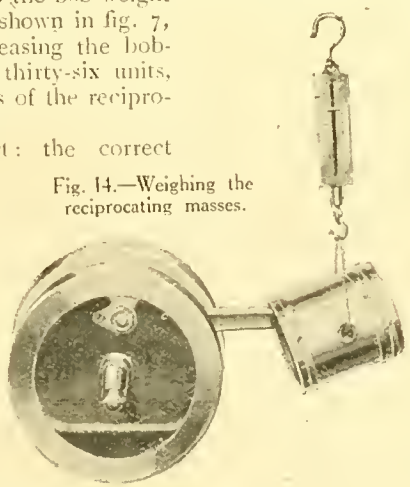

Fig. 14.—Weighing the reciprocating masses.

Twin Engines.

Turning now to the consideration of V twin engines, fig. 8 shows the forces for a 60° twin (the centre lines of the cylinders are shown) with short connecting rods. For a particular reason, the diagram has been drawn for an engine of the same bore and stroke as the single already dealt with. For real comparison with the single, in fig. 8 there has been added a smaller curve giving the forces for a twin of the same total capacity of the single: its maximum is fifteen and a half units, as compared with thirty-six as the best for the single—no wonder twins are smooth-running! The bob-weights here are one and one-twelfth the reciprocating masses of one cylinder; *i.e.*, slightly more than half the total reciprocating masses. But we are usually told that the 90° twin is far above others for balance—in fact, it is supposed to be perfectly balanced. Accordingly, its forces are shown in fig. 9. The "big" twin shows twenty units maximum, or ten for equal capacity with the single. (Henceforward only the forces for the big twin are shown; divide by two to compare them with the single.) Bob-weights are slightly less than in the case of the 60° twin.

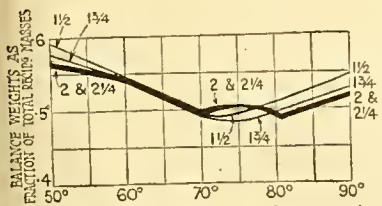

Fig. 15.—Each curve gives, for a certain length of connecting rod (in terms of the stroke), the portion of the total reciprocating masses which should be balanced.

Obviously, the 90° twin is not perfectly balanced with short connecting rods, though it is for long ones. As a matter of fact, on trying several angles it was found that the best results for connecting rods of one and threequarter stroke-lengths were obtained (fig. 10) for an engine of 75°, in which case bob-weights of slightly less than half the total reciprocating weights gave a maximum force of eighteen units. If longer connecting rods are used, the angle should be greater, as shown in fig. 11, which is the best for connecting rods of twice the stroke. The cylinders are at 82½°, the balance-weights exactly half the reciprocating parts, and the maximum force is sixteen units.

Hence we have found another important point: the best angle for a twin is *not* 90°, but a smaller angle, its exact value depending on the length of the connecting rods.

Radial Engines.

Another engine popularly supposed to have perfect balance is the radial. Actually, this would appear to be not perfect even with infinite connecting rods. With short rods, it gives the results shown in fig. 12, which is for an engine of the same total capacity of the twins already considered. It will be seen that the maximum force is greater than that of the 90° twin, let alone the 75°. Of course, it must not be forgotten that the balance of moving parts is not the only thing to be considered. There are the questions of uneven firing intervals, crankshaft stresses, etc., in many of which the radial is much to be preferred.

The Flat Twin.

One case where theory and practice agree thoroughly is that of the flat twin. No diagram of unbalanced forces is shown here, because there are none. In this case every moving part has a corresponding part moving in the opposite direction, and complete balance is obtained for all connecting rod lengths, except for a small force of a different kind caused by the fact that the use of a two-throw crankshaft necessitates the two connecting rods being out of line with one another.

In actually attempting to improve the balance of a given

Fig. 16.—Where to hang the test weights on the flywheels: A, ⅛in. hole to take a wire hook.

The Balance of Motor Cycle Engines.—engine, three problems arise: first, to find the weight of the reciprocating parts; second, to find whether the balance weights are correct; and third, to make any alteration required. Unfortunately, the angle between the cylinders cannot be altered, but we give a curve (fig. 13) showing the best angle for various lengths of connecting rod. To weigh the reciprocating masses, hang one of the pistons on a spring balance, with the connecting rod horizontal and the big end supported, as in fig. 14. In the case of a twin check by weighing the other in the same way: they must be equal, or it is useless to attempt successful balancing. Now, having measured the connecting rod length, find, from the curve in fig. 15, what proportion of the total reciprocating masses should be balanced.

Drill a small hole through the flywheels opposite the crank-pin and at equal distance from the centre, as shown at A in fig. 16; arrange a pair of level runners at such a height and distance apart that the two ends of the main shaft can roll on them, taking care to level them accurately. If there are ball bearings to the main shaft, the two halves of the crank case can be used: the only necessity is that the flywheels should be perfectly free to rotate with the connecting rods and pistons hanging free (fig. 17). Now, hang from the small hole above-mentioned weights equal to the total reciprocating parts *less* that portion which should be balanced: for example, in a 60° twin with connecting rods of one and threequarter strokes, the bob-weights should be 0.55 of the total reciprocating masses; so weights of 0.45 should be hung on the flywheel. When this has been done the flywheel should remain indifferently in any position. If any one part tends to remain at the bottom, that part should be lightened, or the opposite point weighted: the alteration must be made at a distance from the centre exactly equal to the crank radius. Lightening, by simply drilling out metal, is the simpler method: weighting the opposite side by drilling out and filling the holes with lead is the better, as it increases instead of diminishes the total flywheel weight.

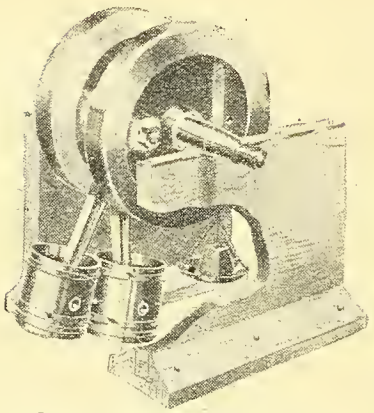

Fig. 17.—Arrange a set of runners on which the flywheels can roll freely, with the pistons, etc., hanging free.

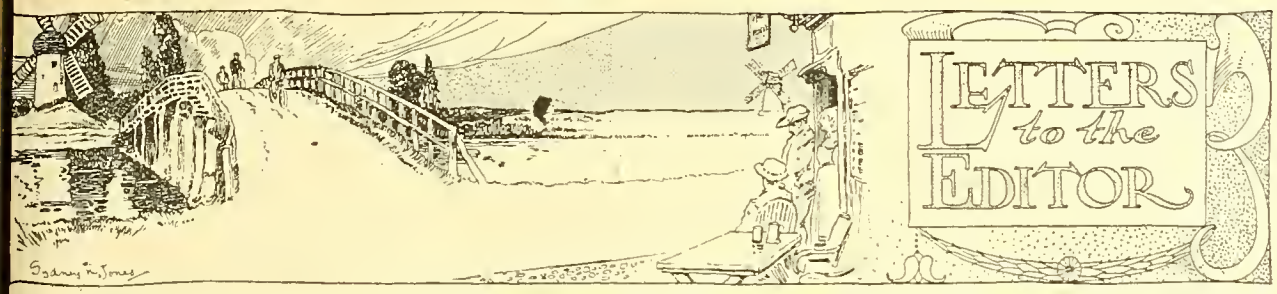
Care must be taken, in lightening, that the drilling is not enough to cause weakness, and in weighting that there is no possibility of the plugs coming adrift.

TABLE FOR SINGLE-CYLINDER ENGINES.

Connecting rod ÷ stroke	1½	1⅝	1¾	1⅞	2	2⅛	2¼
Balance weights ÷ reciprocating parts	2/3 (.667)	17/26 (.654)	9/14 (.643)	19/30 (.633)	5/8 (.625)	21/34 (.618)	11/18 (.611)



This table shows the correct bob-weights, expressed as a fraction or decimal, for various connecting-rod lengths.

Prices of Second-hand Motor Cycles.

A Schedule of Prices at which used and shop-soiled Motor Cycles were being offered in the miscellaneous advertisements of last week's issue of "The Motor Cycle."

Make, H.P., and Date.	Classified Prices.	Average Price.

STANDARDISATION OF CONTROLS.

Sir,—As regards the standardisation of throttle controls, it appears to me to be an open question.

With touring bars the more easily manipulated controls are those which open inward, whilst with T.T. bars it is more convenient to have them opening outwards. In fact with more or less straight T.T. bars it is almost impossible to open the levers inwards. It would therefore seem that the only solution is to use the two types, the one for touring bars and the other for flat bars.

Douglas, I.O.M. AUREA MEDIOCRITAS.

ANOTHER LICENCE POSITION.

Sir,—Through the medium of your valuable paper, I should like to give a tip for fixing the new licence holder to a 1921 and possibly 1920 model Matchless. If the top and bottom screws of the brass fitting that holds the windscreen in place in the near side are taken out it will be found that most of the licence holders can be fitted on very neatly with the same screws again. It is quite a simple job, and saves damaging the sidecar in any way. A brass holder is best, as it matches the windscreen. T.M.

Leigh-on-Sea.

2¾ H.P. DE DION HINTS WANTED.

Sir,—I am assembling a machine with a 2¾ h.p. De Dion engine, and I should be glad if Mr. B. F. C. Fellowes would give me a few hints on it, and also what consumption I am likely to expect. The carburetter is a Binks. I should also like to know its climbing powers, as I contemplate making it a single speed 'bus.

To change the subject. I do not like the A.C.U. standardisation system. It merely makes things hot for those manufacturers who are sensible enough to fit controls opening outwards. To my mind, the choice of direction of opening should be left to the discretion of the rider concerned.

NORMAN H. MILLS.

WHO ORIGINATED DISC WHEELS?

Sir,—I think it would be most interesting to know who claims to be the originator of disc wheels as fitted to motor cycles. I may say that I fitted them as far back as 1912 to a 3½ h.p. Triumph, but they were not to be compared with the present-day fitment. I made them out of sheet aluminium and riveted them so as to make the conical shape required. As I used to ride quite a good deal in London, I presume many motor cyclists of a sporting nature copied my idea, for on returning from the East I was amazed at their popularity. Although I do not claim to be the originator, up to the time of fitting them myself I had never seen them fitted to any other motor cycle. I took the idea from discs on cars, which I first saw fitted on the Continent.

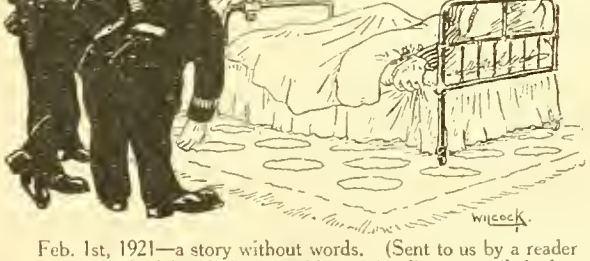
CHAS. DAUNTON-SHAW.

ARE MOTOR CYCLISTS FICKLE?

Sir,—The letter penned by "Crimson Rambler" and published in *The Motor Cycle* gave me much pleasure in reading. As pointed out by him, a certain section of us motor cyclists do make a point of purchasing a new 'bus yearly, probably after spending many a pleasant hour at the Show, and also, probably, very many more regretful ones after. But that is beside the point. There is another section who, from lack of funds, keep their "grids," take an interest in and retain them until such time as the pass-book shows favourable figures. Then, hey presto! . . . There is also (and I belong to it) another section who buy a machine, spend their leisure hours working on it (when not riding) and get it into such trim and tune that it becomes part and parcel of their existence. Then, and then only, can such an owner become really enthusiastic. He knows its every mood and humours it accordingly, the result being that his pleasure is assured all the more because he has personally contributed in no small degree towards it.

My own machine, a 1915 2¾ h.p. three-speed T.T. Douglas is such a 'bus. It was bought in 1916 (quite 10,000 miles was to its credit at the time), and through careful, yet hard driving, is to-day, like Charley's Aunt, still running, and well at that. I have covered over 30,000 miles on it, have yet to record a breakdown, and hope to cover another 30,000 before I shall, with regret, part with it. It will do 55 m.p.h. in touring trim (proof if required). It has just been thoroughly overhauled, new parts fitted where necessary, re-enamelled (Robbialac, by hand), and could not be bought for £100. I am with "C.R." every time when he says that heartache is bound to be caused through parting with one's pet machine. I shall delay that parting as long as I possibly can.

MARTIN J. WRIGHT.



TO SAVE SHOE LEATHER!

Sir,—Referring to "Bow-wow Bang's" letter, I may say that I anticipated his "cerebral undulation" about a year ago. Being at that time much troubled by local canine projectiles with uncertain trajectories and velocities, but which only rarely impinged on my toe, I took to carrying anti-dog bombs in the form of burnt out electric bulbs.

I only used two, but they were highly successful. The victims promptly retired with shell-shock. The vacuum exhausted their lungs in a single yelp, and they departed from my path for ever on top gear with an acceleration causing audible claw slip.

As I thought that the remnants of glass and metal might damage tyres, I reluctantly abandoned the treatment, and carried a dog whip, but found it disappointing. In the end, I tactfully interviewed one or two dog owners (without the dog whip), and am pleased to say that since then canine projectiles have almost ceased to velocitate in my direction.

Saltburn. DOG-BOMBER DICK.

Feb. 1st, 1921—a story without words. (Sent to us by a reader who apparently delayed obtaining his taxation licence until the last day, and now finds that the authorities are so busy serving other laggards that he is without the use of his machine.)

RIGHTS OF WAY.

Sir,—I read in *The Motor Cycle* Mr. A. W. Bailey's suggestion that the "right of way" at cross roads should be indicated by black lettering on the sign visible to the approaching driver and red lettering on the road which has *not* the right of way. Theoretically, this seems sound; but I am very dubious about the working of it. At present every good driver takes it for granted that he has not any right of way, and, accordingly, proceeds cautiously; but if he is encouraged to dash on, conscious of his right, what happens if, at the cross roads, he meets that terror who, in spite of red letters, prefers to risk losing a limb rather than losing a minute?

Without any right of way, there is only this terror who rushes cross roads. H. FRANCIS KINGSTON.

FOLDING SIDECARS.

Sir,—I venture to write my experiences of folding sidecars. As a tradesman desiring some kind of an adaptable arrangement for pleasure and work, I decided on a folding chassis and sidecar. I purchased one made by Hopleys, Upper Highgate Street, Birmingham, during the year 1915, to which I also fitted a box sidecarrier for carting working plant about (being in the building trade), so that I am able to change from sidecar to box or *vice versa* in one minute.

During the five years I have had this chassis practically in daily use I have not had the slightest trouble with it, no screws or joints coming loose; in fact, it is as rigid as ever, and I have had weights in the box amounting to 4 cwt., and have done a great amount of touring with a ten-stone passenger and the necessary luggage. I consider this bears good testimony to the reliability of this make of chassis, and to those desiring an adaptable arrangement I can honestly recommend this to them. SATISFIED.

Sparkhill, Birmingham.

CRUELTY TO SIDECARS.

Sir,—In your issue of January 13 Mr. Leat gives an illustration of a Clyno and sidecar doing farm work.

In the early days of the war I was having a short holiday in Bishopdale. My host, an elderly gentleman and small farmer, had a two acre field ready for loading. Being the middle of hay time, labour was scarce and horses difficult to get. The weather, also, was very unsettled, and mine host was uneasy about his hay. I asked him if he had a sledge. (Sledges are always used in the fields in the high parts of the Yorkshire dales.) He had the sledge, but nothing to pull it with, so I suggested my 'bus, an 8 h.p. Matchless and sidecar. This was coupled to the sledge by a rope from the sidecar chassis. We set off for the first load at 6 p.m., and had all the hay up (and a good heavy crop, too) and in the house, and mine host, myself, and gentleman friend enjoying an excellent Yorkshire dale supper at 9.30. The only assistance required was a slight pull when starting off with the loaded sledge owing to the back wheel slipping on the grass. I have seen motor cycles used for various work, but never before, or since, have I seen one with a sledge full of hay at the back of it. WALTER WATERHOUSE.

LUCK (?) IN TRIALS.

Sir,—Some months ago there were several letters in your excellent paper dealing with luck in trials. I think this letter might be of interest to some of your readers. During the past eighteen months I have entered five twenty-hour trials, and never once have I gained an award. The following are the reasons:

(1.) York to Edinburgh and back, 1919. Notwithstanding the fact that the back and front tyres were new, we managed to get two punctures and a burst, eventually having to buy a new sidecar tyre.

(2.) London-Exeter, 1919. The failing of our electric lights and a puncture were the main causes of our retiring on this trial.

(3.) Jarrott Cup, 1919. In this trial we also had two punctures—one in the sidecar tyre and the other in the petrol tank. The latter was caused by the sparking plug blowing out and badly splitting the tank.

(4.) London-Edinburgh, 1919. A chain broke a few miles from a check, and in the consequent blind we had a nasty skid, bending the front forks so much that we could not proceed. It was a new chain on a new machine.

(5.) London-Exeter, 1920. Into this trial I took a new Alecto solo, and, for the first time, had an absolutely no-trouble ride, and arrived at Staines very satisfied, only to find now that I have been disqualified through arriving early at the secret check at Whitchurch, my watch having "crocked" early in the trial. In this case it was particularly bad luck, as the friend from whom I was taking my time, and who left the control a minute before I did, took the wrong road after leaving the Salisbury check, thus allowing me to get in front of him without my knowing it, and it was in trying to catch him up, thinking he was ahead, that I became early.

London, S.W.4. R.S.R.

The days are slowly lengthening, and the motor cyclist's thoughts turn to spring and picnics away from the madding crowd. Here is a party which has reached the banks of the Wye between Rhayader and Builth Wells with the aid of an A.J.S. outfit and a New Hudson lightweight. Such beauty spots are inaccessible to those who do not know the joys of the motor cycle.

DOG CATCHING.

Sir,—Is the following occurrence unique? On Boxing Day, in Aylestone Lane, Leicester, a small rough-haired fox terrier made a dash at my machine (nothing unique in that!). As I passed it I heard a yelp and felt a drag, and pulled up promptly. Looking round, I could see nothing, so I got off, and after a moment's inspection I found, to my amazement, that the unfortunate dog was jammed on the top of the wheel under the mudguard. So tightly was it fixed that, unaided, I could not release it; but with the help of a passing car driver and a couple of near-by footballers, by pulling the wheel round and hauling at the dog, we at last succeeded in getting it out, and—*mirabile dictu*—the dog trotted away under its own power, seemingly none the worse for its adventure.

My machine (a 2¾ h.p. Wilkin), in spite of a 3in. back tyre, has a large mudguard clearance, and is fitted with a steel strap puncture preventer fixed to the carrier stays. It was this, apparently, which prevented the dog from being carried further round the wheel. But how did it get there? I could understand it getting tangled in the spokes, but it was on top of the tyre and nowhere near the spokes. Can any of your readers relate a similar experience?

(Rev.) J. M. PHILPOTT.

LUBRICATION COMPARISONS—CAR AND MOTOR CYCLE TYPES.

Sir,—May I, with some nervousness (as the amateur with the expert), disagree with your contributor "Ixion" on the desirability of sump lubrication for motor cycles.

Before buying my first motor cycle last summer, I was a car owner-driver for eight years, and, therefore, approached the motor cycle from a somewhat critical standpoint, but have been agreeably surprised, among other things, with engine lubrication, which I had always considered to be of a very rough and ready kind as compared with a car.

Your contributor is, of course, correct in what he says about drip feed, but I am convinced that a far better alternative to the sump is a mechanical pump similar to that now fitted to the P. and M., which delivers fresh oil alternately to the cylinder walls and big end.

As regards sump lubrication on cars, your correspondent, "Patient Pete," is right when he says that the ordinary car is not lubricated with oil beyond the first few hundred miles after refilling the sump, and I do not think that this system would prove more satisfactory on a cycle, when the sump would contain a smaller volume of oil, and the engine would be working under harder conditions.

I do not, however, agree with him that as regards oil economy the car has it all the time. I, myself, found that to obtain perfect lubrication a car sump had to be drained every 500 miles, and never allowed to remain longer than 1,000 miles, and with a large sump the amount of oil used is considerable. (I am aware that not one car in a thousand is treated thus, but that does not disprove my point.)

While on the subject of lubrication I should like to mention my experiences of enclosed all chain drive. I have had no experience of shaft drive on cycles, but as between chain and belt, of which I had some experience under active service conditions, I greatly prefer the former.

The P. and M. system includes a pipe conveying any surplus oil from the crank case to the chain case, which has the great advantage of making it impossible to make the engine smoke for any but the shortest periods, and in spite of a very free use of the auxiliary hand pump at first, I have never sooted up a plug, and there is yet no outward sign of carbon deposit.

At the same time I do not consider this entirely adequate for complete lubrication of the chains, and have always supplied very thick gear oil (Vacuum C.C.) direct to the chain case. As a result, I believe, of this, after about 1,500 miles, all chains are as tight as when delivered, showing no signs of wear, and have never been adjusted.

In conclusion, speaking as a late car owner, I should like to record with pleasure the great (and to me, unexpected!) reliability of the modern motor cycle, and the ease of maintenance as compared with a car. The essential finish, of the P. and M. at least, is superior to any car I have owned. For example, whereas a car engine will become externally an oily mess unless cleaned almost daily, I find that all crank case joints are so perfectly made that it hardly shows a speck of oil outside even in the hottest weather. While on the subject of cleanliness, why are so many cycle engines spoilt, as to appearance, by rusty cylinders, when by applying blacklead mixed with turpentine, a finish can be given that seems impervious to wet? K.B.

Charlbury.

NOVELTY IN DESIGN AND CONSTRUCTION.

Sir,—Your welcomed criticism on the two-speed gear incorporated in my design for a motor cycle, which appeared in your last issue, prompts me to show you the line of reasoning I adopted before putting even pencil to a sketch block in an attempt to achieve simplicity and cheapness in motor cycle manufacture, and yet provide something more than the minimum considered desirable, from a point of view of handiness in control, weather protection, etc.

Thusly—

Me: We'd simply love to have a three or four-speed box and a real clutch.

Myself: Remember, my son, you are standing the racket yourself for experimental 'buses.

Me: Yes, that's so. Well, then, let's have a really simple thing—say a selective type dog clutch two-speed gear. That *will* be cheap.

Myself: But what about getting under way and changing up and down?

Me: Oh—ah—of course; we need a clutch.

Myself: Right oh. Suppose we substitute a friction clutch for the low gear dogs. We can start off nicely; we can change up on the exhaust lift or throttle. The clutch will come in handy in changing down, and it *can't be slipped on high gear.*

Me: Of course, you'll want a decent shock absorber in the transmission. But you'll need that in any case with all-chain drive.

Myself: Then, that is settled. It won't cost much, and it will be simple. Let's go into details.

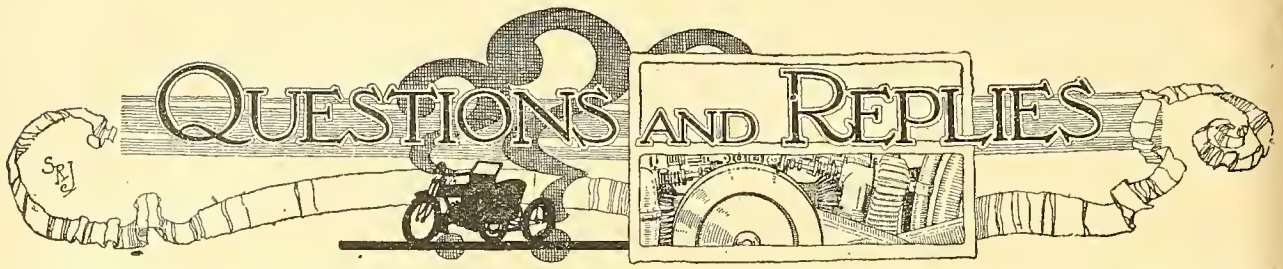
The same sort of inward conversation took place when the cylinders, etc., were being decided upon. And in the same way were all other superfine details reluctantly shelved.

May I point out to interested readers that I shall be only too pleased to go into the thousand and one details—necessarily omitted through space limitation, etc., from your admirable journal—if they care to take them up.

The methods of construction, details, and accessories alone have accounted for more than six months of my spare time, the whole machine having been nearly two years on the paper "stocks." Now, unfortunately, funds are getting low ("excessive economic pressure," some call it), and a purely personal attempt at manufacture has become rather remote. However, the essentials of the design are covered by patents, and time will show what can be done in the way of production.

There is a sidecar to go with the machine, and in its design a real attempt has been made to eliminate all forces which tend to distort the frame of the cycle to which it is attached.

Simplicity, cheapness, and sound principles of design have again been the watchwords. I. P. MILLAR.



SUMMARY OF CORRESPONDENCE.

Regarding "W.D.W.'s" speedometer lamp on page 30, Mr. Paul Taylor recommends a No. 126 Ever Ready battery which may be obtained in neat canvas case with straps for attachment to the machine.

Referring to correspondence on increased A.A. subscriptions, Mr. C. G. Virgoe considers that, if dissatisfied members made more use of their association in such matters as route finding, etc., they would view the matter in a different light. Personally, he praises the organisation of the A.A., judging from his own experiences with its Touring Department.

We have received numerous letters describing home-made licence holders, and more particularly licence holder clips. A few of these are obviously intended for "Ideas" page, but their number and similarity prevent us publishing them *en bloc*. It may be inferred, however, that a great many motor cyclists are adapting this new fitment to all sorts of weird fixtures and positions.

Recently there has been a gratifying lack of complaints regarding what is very popularly and freely called "profiteering," *i.e.*, charging more for an article than the customer considers it is worth. This week, however, there is a "Disgusted" who complains of being compelled to pay 9s. 6d. for a new throttle lever.

A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

CASE HARDENING.

I am just overhauling my motor cycle, and wish to case harden a piece of mild steel. Could you, please, tell me how this is done?—W.G.

The most effective way of case hardening mild steel is by means of the patented preparations which you can buy at most large ironmongers or tool warehouses. Both "Kasenit" and "Rapid Durvite" are very effective, and full instructions are printed on the packages

CLUTCH SLIP.

I am having a great amount of trouble with my clutch, which is of the Ferodo ring variety. The makers say that the rings might be worn, but I feel sure they are not. I have repeatedly cleaned them and washered the springs. The metal plates of the clutch are quite shiny.—A.G.W.

Slipping with this type of clutch is due either to wear of the Ferodo rings or to oil on their surfaces. If the latter, the remedy is obvious. In the former case either new rings must be fitted, or you might fit an extra one at the side of the sprocket, that is to say, lay the two rings side by side between the sprocket and the next steel plate. This has the effect also of increasing the tension on the springs, and usually cures the trouble.

NO COMPRESSION AFTER OVERHAUL.

My 1912 Triumph has been running well for the last two years, giving me very little trouble. I have taken the cylinder off, removed all carbon deposit from piston, ground in valves, freed the rings (which have had very little wear), and on assembling find that there is practically no compression. When turning the pulley round there seems to be only a sucking in and blowing out of air, through the pulley centre. Before dismantling the compression was quite good. Being about to sell the machine, am I liable to a fine if I run it on the road to show the customer, having taken out no Revenue licence this year?—G.W.

It often happens that an engine has very little compression on reassembling after overhaul. About fifty miles running on the road would put this right. Of course, we take it that you have taken all the usual precautions, such as tightening the valve caps, sparking plug, and compression tap. If you take the machine on the road at all you become liable to pay the Inland Revenue taxation.

UNDER OILING.

I have a 1909 or 1910 P. and M. 3½ h.p. two-speed gear with B. and B. carburetter variable jet. On taking the machine out I could climb a good stiff hill on top gear with sidecar and passenger, but after doing from ten to fifteen miles I cannot take the level on the same gear, and there is a very distinct knocking about the engine. Immediately I change down the engine runs very smoothly and simply roars along.—A.G.

The details you give are insufficient to enable us to diagnose accurately your trouble. You should use a first-class heavy grade oil suitable for air-cooled engines, and a charge should be given every six miles when riding with sidecar and passenger.

Important Dates.

Feb 21st-28th—
Paris-Nice Trial.

March 25th—
Richmond Meet.

March 26th—
M.C.C. London-Land's End Trial.

April 27th—
A.C.U. One-day Winter Trial for Stock Machines.

May 14th—
M.C.C. London-Edinburgh Run.

May 25th—
A.C.U. Silencer Trial — Brooklands.

June 14th-16th—
Tourist Trophy Races.

June 25th—
M.C.C. Inter-team Trial for "The Motor Cycle" Cup.

July 6th-7th—
Arbuthnot Trophy Trial for Naval Officers.

July 23rd—
Grand Prix Race—Le Mans.

August 8th—
International Six Days Trial—Geneva

August 28th to Sep. 3rd—
A.C.U. Six Days Trials.

Sep. 17th—
Grand Prix Race for Cycle Cars.

HOT CRANK CASE.

I have a 1919 Triumph, which I ride solo. The machine runs well, but the crank case and carburetter get so hot that it is impossible to bear one's hand on them. I give plenty of oil (Price's Huile de Luxe), and the machine has only run 1,000 miles. I decarbonised after having done 800 miles. Is this usual, or, if not, what is the cause and remedy? I always ride with the air lever fully open and at moderate speeds.—B.W.C.

If the machine is quite powerful and capable of maintaining fairly high speeds indefinitely, there is no need to worry about the heating of the crank case, which is probably due to conduction in the cylinder. If the engine overheats, however, and knocks when picking up on top gear, it evidently requires some attention, but you do not give sufficient details of the trouble.

BENZOLE FOR TWO-STROKES.

(1.) Is benzole as suitable as petrol for a 2½ h.p. air-cooled two-stroke? (2.) How does it compare with petrol as regards economy, hill-climbing, cooling, starting from cold, and speed? (3.) Would any alteration to Amac standard carburetter be necessary? (4.) Is a half and half petrol-benzole mixture more satisfactory in these respects?—B.A.W.

(1.) Benzole is quite suitable. (2.) Hill-climbing will be better, starting quite as easy as with petrol, cooling about the same, and 10% to 15% more miles per gallon should be obtained. (3.) It might be necessary to fit a slightly smaller jet, but you should first try the effect of lowering the level until it is $\frac{3}{32}$in. below the top of the jet. (4.) The petrol-benzole mixture can be used without any alteration to the carburetter setting.

A DRIP FEED TROUBLE.

I recently dismantled the drip feed on a J.A.P.-engined lightweight to clean the glass, which was very dirty, and since then I have been troubled with a distinct snort in the glass chamber, as though part of the compression was being blown up the oil pipe. The oil union on the crank case is a clear passage, as is the oil pipe itself. There is no ball or disc valve of any kind. Is this as it should be? Inside the pump there was a small flat disc of metal, which I think I replaced wrongly. This, I think, is probably the cause of the continued snorting noise. Should there be a valve in the crank case union?—G.D.

You have probably failed to replace the small disc valve which is normally situated in a small valve chamber below the drip feed body. We should recommend that you write to the makers of the drip feed for a diagram of the device, as you will understand this much better than any explanation in words. It should not be necessary to have a non-return valve where oil pipe enters the crank case. Make quite sure that there are no air leaks past the edges of the sight glass.

EXPERIENCES WANTED.

"R.M." (Streatham).—Cleveland two-stroke; general experiences.

"C.S.B." (Leicester).—2¾ h.p. Coulson B; life of engine and spring frame; stability.

READERS' REPLIES.

Removing Rust.

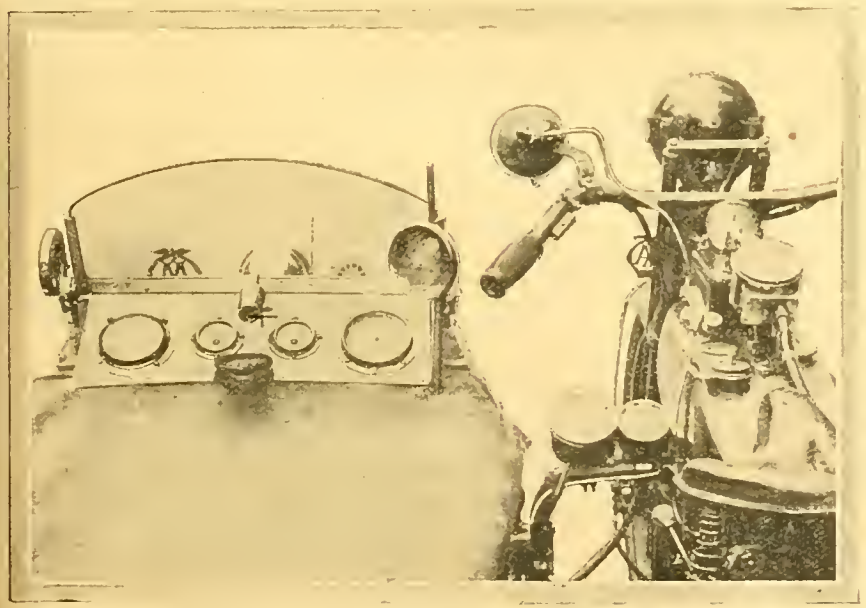
Re letter from "L.W." in your issue of January 20th, asking for a tip for removing rust from plating, I am pleased to say I came across a capital article at the exhibition held in Glasgow last November. It answers the purpose admirably. It is called "Rustrimova," and can be had from the Silver Replating Powder Co., Stoke Newington, London, N.16. They have also a "Nickeldep" for depositing nickel on handle-bars, etc. —T. A. McCREADIE.

In your issue of January 20th, you advise "L.W." to use fine emery-cloth for removing rust from plated parts. This, of course, cuts the plating unless very carefully used. If fine pumice flour is used, applied with a rag dipped in a *weak* solution of oxalic acid, the rust will be removed with far less damage to the plating. This treatment will remove both rust and mildew from steel, nickel-plating, and aluminium, but great care must be used to clean off carefully, and dry the part treated, as any acid left on will gradually eat into the metal. —A. W. STILES.

I notice "L.W." wishes to know of a good rust remover capable of taking rust off the nickel parts of a motor cycle. May I say that I have found good quality typewriter eraser rubbed over the affected parts to be very satisfactory. If the rust be very bad, first soak a rag with paraffin, and well rub over the rust to remove as much as possible; this will loosen it; then, when dry, use the eraser, and the rust will come away. I have used this with every satisfaction on affected nickel parts of typewriters, and I have also used it for motor cycle plating with good results.—J. E. WHITE.

RECOMMENDED ROUTES.

NEWCASTLE TO CHESTER (avoiding traffic). —A.F.



Newcastle, Neville's Cross, Darlington, Northallerton, Ripon, Ripley, Blubberhouses, Skipton, Gisburn, Clitheroe, Preston, Ormskirk, Liverpool, by ferry to Birkenhead, Chester.

WOOBURN GREEN TO WESTON-SUPER-MARE. —W.T.S.

Wooburn Green, Marlow, Henley, Reading, Theale, Hungerford, Marlborough, Calne, Chippenham, Bath, Chelwood, Compton Martin, Sandford, Weston-super-Mare. Approximately 127 miles.

ALDERSHOT TO YORK.—W.F.

Aldershot, Farnborough, Bagshot, Ascot, Windsor, Slough, Beaconsfield, Amersham, Chesham, Tring, Dunstable, Westoning, Ampthill, Bedford, Eaton Socon, Alconbury, Hill, Norman Cross, Wansford, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Brotherton, Tadcaster, York. Approximately 225 miles.

ACCESSORY COLLECTION AS A FINE ART.

A very complete Harley-Davidson outfit owned by Mr. J. L. Marvin, of Ballards Motors. On the sidecar dash there is an aneroid, volt and amp. meters, a clock, a compass, and a lamp to illuminate them. Both the A.C.U. and the A.A. badges are carried in front of the Triplex glass screen, on the left of which is a licence card holder, and on the right a mirror. In addition to the usual lamp equipment, an American "spot" light for reading signposts is on the handle-bar, while between the sidecar and the motor cycle are an air speed indicator and a revolution counter. A speedometer and a gradient meter with a lamp are on the top tube, and in order to make the outfit really complete, there are a hand Klaxon, a cigarette lighter, three mascots, and several other items of a mechanical nature.

SPARKLETS

To Golf Enthusiasts.

Many motor cyclists who also follow the royal and ancient game will be interested to learn that a branch of the County Chemical Co., Ltd., well known for the Chemico motor specialities, is concentrating on golf ball manufacture.

Motor Cycles for the Police.

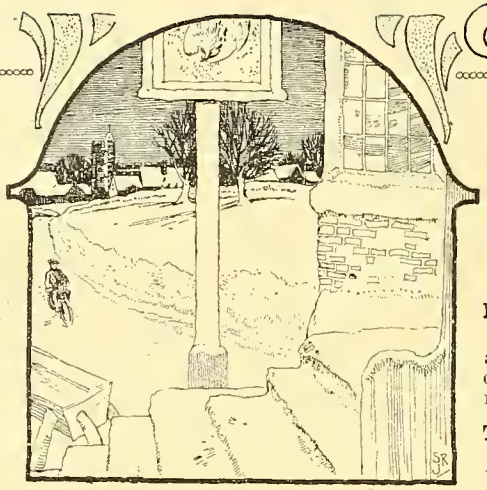
As the utilitarian value of the motor cycle becomes recognised by the police, its use by the authorities will increase. In the meantime it may interest chief constables to know that hundreds of machines are in use in New York, Philadelphia, and Boston. Incidentally, over two hundred of these machines are Indians.

Chat on Chains.

The above is an apt title for a useful booklet which tells the rider about the chain, what it is, and what it has to do. It also gives information as to how to minimise the effect of destructive factors on chains, deals with their lubrication, the effect of bad alignment, eccentric and oversize wheels, and gives other information concerning the cause of chain defects and wear. The booklet is published by Messrs. Brampton Bros., Ltd., Oliver Street Works, Birmingham.

Catalogues Received.

A. J. Stevens and Co., Ltd. (1914), Graiseley House, Wolverhampton: Describing the new 7 h.p. 1921 model sidecar outfit. Detail photographs of most of the distinctive features are well reproduced.



B.S.A. Cycles, Ltd., Birmingham: Complete specifications of the B.S.A. single-cylinder machines with chain-cum-belt and all-chain drives, also the 6 h.p. twin outfit with chain drive and interchangeable wheels. The very moderate price of the chain-driven single is remarkable.

Enfield Cycle Co., Ltd., Redditch: Brief descriptions and specifications of the Royal Enfield models, both 2¾ h.p. two-stroke and 8 h.p. sidecar outfit. Special attention may be drawn to the trade delivery outfit, which consists of a standard machine and chassis with a special box carrier mounted on the latter. A touring body may be easily substituted.

Ward and Goldstone, Ltd., Frederick Road, Pendleton, Manchester: The first catalogue to be received from the new address of this well-known electrical accessory house is the sectional list dealing with supplies for motorists. All manner of electrical novelties are mentioned, and its pages should be studied by all who contemplate, or already use, electric lighting on their motor cycles.

H. Collier and Sons, Ltd., 44, Plumstead Road, London, S.E.: The Matchless machine is well described in this leaflet, and its salient points are almost too familiar to need mention. A model which is apt to be forgotten is the double-seated sidecar "family" outfit.

Weights.

All 2¾ h.p. Douglas machines, of any date, with the exception of the new o.h.v. Sports model, are under 200 lb.

A Health Bulletin.

We are pleased to learn that Mr. George Stevens, of Messrs. A. J. Stevens and Co. (1914), Ltd., who recently had to undergo a serious operation, is now making good progress towards recovery.

Buy Now.

Both to ease the present heavy unemployment figures, and to avoid a very possible rush, with all its "delaying" consequences, potential buyers are advised to place their orders for new mounts at once.

Help Wanted.

Motor cyclists who would care to assist in what promises to be a most sporting event (the Western Centre A.C.U. Two-day Trial on April 8th and 9th) should communicate with the Trials Secretary at "St. Moritz," Wyche Road, Malvern.

The Legal Limits.

The A.C.U. is asking all its members to give their opinion on three important points, upon which, it is understood, recommendations will shortly be made to the Minister of Transport. The three questions of the A.C.U. are: (1.) Should there be any limit of speed for motor cycles, bearing in mind that the removal of a limit might encourage prosecutions for driving to the common danger? (2.) Should the 20 m.p.h. limit be increased? (3.) Should applicants for driving licences be required to undergo tests? The A.A. also is asking all motorists for their opinions as to whether 30 m.p.h. is a suitable speed limit.

Ten Thousand Orders.

10,000 letters were received by Maudes' Motor Mart, 100, Great Portland Street, London, W.1, in connection with their second offer of a free 4 h.p. Verus Blackburne motor cycle and two Autoped scooters to the senders of the first three orders opened on Monday, January 24th. The winners, respectively, were: (1) Mr. H. O. Bryant, 46, Poplar Avenue, Edgbaston, Birmingham; (2) Mr. W. N. Fowles, London House, Lord Street, Wotton-under-Edge, Glos.; and (3) Mr. F. W. Wells, Market Place, Alford, Lincs.

A similar draw was held by Maudes' Motor Mart Depot at Paris Street, Exeter, on the same date, the winners being: First prize (2¾ h.p. Verus-Blackburne), Mr. Froggatt, John Street, Scunthorpe, Lincs., while the second prize was won by Mr. Bonser, the Café, Salcombe, Devonshire.

Prices.

Apropos our remarks last week concerning the improbability of a reduction in the prices of motor cycles at the present time, it is interesting that one firm—the makers of the Coulson—have had slightly to increase the prices of their 2¾ h.p. and 4 h.p. three-speed models. The prices of these are now 96 guineas and 120 guineas respectively, as compared with 95 guineas and 118 guineas as ruling in 1920.

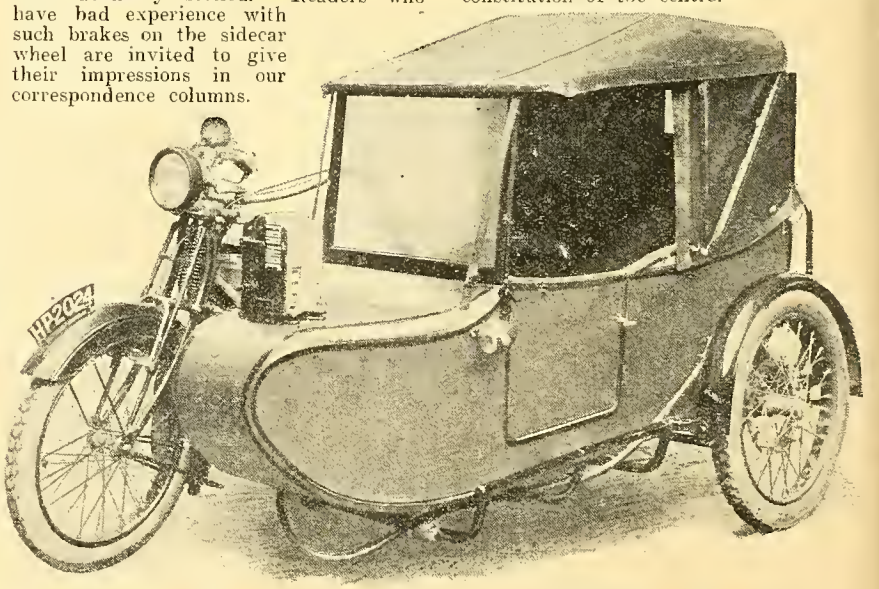
Sidecar Wheel Brakes.

The official consulting engineer to the Birmingham Police, who passes all taxi-cabs for that city, is advocating that brakes be fitted to sidecar-taxi wheels. Our experience with sidecar brakes has led us to believe that they can be very dangerous, and it is significant that the Rover Co., who at one time standardised a sidecar brake, no longer do so. Whether compensating brakes are less liable to cause erratic steering in the case of an emergency is a question that has never been definitely settled. Readers who have had experience with such brakes on the sidecar wheel are invited to give their impressions in our correspondence columns.

Special Features.

A TRIO ON TOUR.
THE BALANCE OF MOTOR CYCLE ENGINES.
INTERNATIONAL SIX DAYS TRIAL REGULATIONS.

N.B.—in Cambs.



A considerate victim acquaints us of a most efficient police trap which is in operation at the Whittlesford cross roads, Cambridge.

The G.N. to be Made in France.

The French company of Messrs. Gaston, Williams, and Wigmore, and the Société des Moteurs Salmson, are manufacturing the G.N. cycle car in France.

Ulster Centre M.C.U.I.

The Ulster Centre of the Motor Cycle Union of Ireland has for some time past occupied rather an anomalous position, being the governing body of the sport in the province of Ulster and at the same time carrying on the functions of an ordinary club. During the past year the subject was discussed a good deal by the committee, and at the annual general meeting held on January 20th, they made a recommendation to the effect that an end should be put to the anomaly by confining the operations of the union to its original function as a governing body of the sport and forming a new club, to be known as the Ulster Motor Cycle Club, to carry on the work hitherto performed by the centre. Mr. Harold McMullen has been appointed hon. secretary *pro tem.* of the new club, and the existing officers and committee of the Ulster Centre were retained in office to take the necessary steps to alter the constitution of the centre.

Another taxi outfit consisting of a Dalton two-seater sidecar which has staggered seats. The machine has a Coventry-Victor flat twin engine.

How are the Mighty Fallen!

According to *Auto-Technik*, Krupps, of Essen, are turning swords into ploughshares by manufacturing a motor scooter! It is fitted with a 1¾ h.p. engine placed in the left-hand side of the front wheel.

A Misapprehension—

There is an impression abroad that the improved W.D. model 21 2¾ h.p. Douglases are rebuilt from old W.D. material, or that they are actually rebuilt ex-W.D. machines. This is not so, as they are entirely new machines in every respect, only the basis of the design resembling the old but popular W.D. mount.

—And Another.

The Raleigh Cycle Co., Ltd., who are now making deliveries of the Raleigh motor cycle, wish us to correct a prevalent impression that they are fitting a proprietary engine to this machine. A glance at the design, however, should prove instantly that it is original, and entirely of their own manufacture.

What's in a Name?

We have been asked to point out that there is no connection between the two firms who trade under the names of Millfords, Ltd., of Bullock Street, Birmingham, and Mills and Fullford, of Coventry, the makers of the well-known Millford sidecars.

Lost, a Cylinder!

It is astonishing the nature of articles lost by motor cyclists on the road. They vary from spare wheels to suit cases, any one of which, one would think, the owners would hear fall. The latest is the loss of a D.A. cylinder reported by Mr. P. Mister, of 21, Howard Road, Cricklewood, as occurring between Finchley Police Station and Tally Ho Corner.

French Competitions

In a letter from M. F. Colli, treasurer of the Motor Cycle Club de France, we are asked to make it clear that the 1921 Paris-Nice Trial is organised by the M.C. de F., and that that body alone is responsible, and that this fact is a guarantee of good organisation. The M.C. de F. is in collaboration with the *Petit Journal*, and will receive the help of *Motorcyclisme* and the *Eclaireur de Nice;* but, in order to remove suspicion of a fiasco, as last year, the governing body has assumed control. Entries at ordinary fees close on February 10th, and at double fees on the 15th.

The Belgian Grand Prix.

It is officially announced that the Belgian Grand Prix will be held on August 13th, on a fifteen kilometre circuit in the neighbourhood of Spa. As stated in our last week's issue, the Belgian Moto Cyclists' Federation is extremely enthusiastic over its proposed motor cycle Grand Prix, which will take place probably the day before the car event.

"Magnetos."

In our last issue the second edition of A. P. Young's informative handbook, "Magnetos," was reviewed, and those readers who desire to increase their store of knowledge on this subject should place their orders at once. The price is 4s. 6d., or by post 4s. 10d. (home and abroad), from the publishers, Messrs. Iliffe and Sons Ltd., 20, Tudor Street, London, E.C.4.

Martlesham Heath Reunion Dinner.

A reunion dinner for officers of the Aeroplane Experimental Establishment, Martlesham Heath, will be held at the Café Royal, Regent Street, London, W., on February 25th, at 7 p.m. Air Commodore H. R. M. Brooke-Popham, C.B., C.M.G., D.S.O., R.A.F., will be in the chair. Tickets (£1) may be obtained from Captain P. G. Robinson, Room A, 139, Air Ministry, Kingsway, London, W.C.

Prospects of a Scottish Motor Cycle Show.

There is a strong feeling in Scotland that a motor cycle show is necessary north of the border. Prominent members of the trade in Scotland are taking the matter up, and during the present car show in Glasgow a deputation waited on Mr. T. A. Fairley, the secretary of the S.M.T.A., with a view to forming a motor cycle section of the S.M.T.A., and reserving a part of next year's space for motor cycle exhibits.

Club Week-ends on the Coast.

Mr. E. M. Ford, of the St. Leonard's Adelphi Hotel, St. Leonard's-on-Sea, is an old motor cyclist, and contemplates organising week-ends at St. Leonard's among the motor cycle clubs in the London area. The idea is to provide week-end accommodation on first-class lines, with a dance on the Saturday evening and a concert on Sunday night, with trips to interesting local points in between. The idea is a good one, and might be copied by other hotels at favourite resorts.

Cylinder Wear.

According to Mr. W. H. Wardall, who read a paper last week on "Cylinder Wear" before the London Graduates' Section of the Institution of Automobile Engineers, the bore of a cylinder does not in the ordinary way wear truly taper, but in a series of steps.

A Show at Dinner.

In conjunction with the annual dinner and presentation of prizes of the Glasgow M.C.C. on Wednesday of last week, a display was held of 1921 models kindly lent by the various agents in the city. All the popular makes were represented. A large turnout of members and friends spent a most enjoyable evening.

Lost en Route.

During the return run of the Liverpool-Edinburgh Trial on January 23rd, Hugh Gibson, who tied for the premier award on his 8 h.p. Royal Ruby outfit, had the misfortune to lose a suit case containing personal belongings, as well as a 28×3in. inner tube and a set of Lucas electric bulbs in a metal container. It was last seen a little south of Lancaster, and, so far, enquiries of the local police have been unavailing.

A Contrast.

At the request of the Board of Education, Messrs. F.N. (England), Ltd., have sent a 7 h.p. four-cylinder F.N. to the Science Museum, South Kensington. This is a great compliment to the famous F.N. production, which will be housed in the same section as Col. Holden's famous and historic four-cylinder of thirty years ago. A direct comparison between the two will demonstrate the progress of the motor cycle movement during its short history.

Ambiguity.

There are two ways of interpreting the words "manufacturer's name." It may mean the name of the manufacturer or the name of the article marketed by the manufacturer. The two words appear under Section B of the new licences, Subsection *(d)*. We understand that the idea of the Ministry of Transport is that this does not mean the name of the manufacturers of the motor cycle, but the manufacturers' name for the machine. For example, if the owner of an Indian registers his machine he is intended to put the word "Indian" opposite Subsection *(d)*, not the name of the Hendee Manufacturing Co., Ltd., who are, of course, the manufacturers.

WHERE CYCLISTS AND MOTOR CYCLISTS FRATERNISE.

USUALLY cyclists and motor cyclists do not "mix," but members of the Midland Cycle and Athletic Club are exceptions; and last Saturday about 150 members, representative of the car owners, motor cyclists, and cyclists of this old-established club, sat down to dinner at the Queen's Hotel, Birmingham. Mr. C. Gough, the president, was in the chair, and among the many visitors were Major H. R. Watling (of the Manufacturers' Union), G. H. Stancer (C.T.C.), and F. T. Bidlake, the well-known timekeeper. Mr. J. Urry, who is regarded as the father of cycling in the Midlands, in proposing the toast of "The Visitors," urged that cyclists and motor cyclists "run together," as most of their interests were identical. Mr. H. C. Stancer (C.T.C.) suggested that cyclists and motor cyclists should work out their own destiny without interference from the other. He referred to motor cyclists as representing the lion and cyclists as the lamb; but Major Watling, who represented the interests of both, later remarked that from his observations he thought the cyclists were more lion than lamb, but agreed that a coalition body was most desirable.

The M.C. and A.C. has proved that cyclists and motor cyclists can fraternise to the advantage of both, and is doing everything in its power to make the two classes of road users one brotherhood.

One of the features of the M.C. and A.C. dinner was the excellent musical fare provided by the club chorus party in costume, who gave several selections from the "Mikado," which were enthusiastically received. The club is rightly proud of its concert party, which is led by Mr. J. Doherty, jun.

We congratulate the club on its successful year—its thirty-second, by the way.

A SIX DAYS TRIAL IN THE ALPS.

Preliminary Details of the Big International Event to be held in Switzerland, August 1st to 6.h

A 1,200 Mile Course.

WE have previously referred to what should be the finest reliability-trial ever held, and which will start from Geneva, August 1st to 6th. Organised by the Union Moto-cycliste Suisse, 42, Rue du Rhône, Geneva, this trial will be held during a month when Switzerland is looking its best, and when the country is full of visitors from Great Britain and numerous other countries, among whom there should be a large number of potential purchasers of economical motor vehicles.

The trial will be about 1,200 miles in length, and will comprise secret controls and observed sections, hill-climbs, speed hill-climbs, and, on the last day, a kilometre speed trial and the final examination. The competitors will be divided into the following classes: *(a)* individual entries according to category; *(b)* teams of different makes; *(c)* club teams; *(d)* teams nominated by the various countries competing for the International Trophy, presented by the British Cycle and Motor Cycle Manufacturers and Traders Union, Ltd., which is at present held by Switzerland.

The Itinerary.

The course, which is indicated on the accompanying map, will be as follows:

MONDAY.—Geneva to Chaux-de-Fonds.
TUESDAY.—Chaux-de-Fonds to Bâle.
WEDNESDAY.—Bâle to St. Gale, Zurich.
THURSDAY.—Zurich to Lugano.
FRIDAY.—Lugano to Fribourg.
SATURDAY.—Fribourg to Geneva.
SUNDAY.—Examination of machines.

The trial is to take place "no matter what the weather and no matter how many entries are received." Every competitor must belong to a club affiliated to the F.I.C.M. Class A will consist of entries by manufacturers or agents, Class B by individual riders not belonging to the above class, who must sign an undertaking that they are not and will not be manufacturers or agents or paid riders to manufacturers or agents during the trial. The entry fees are: Class A 300 fr. (about £12 10s.), Class B 150 fr. (about £6 5s.). Entries close at ordinary fees on July 15th, and are payable in Swiss money.

The classification will be according to the usual classes: Solo—250 c.c., 350 c.c., 500 c.c., 750 c.c., and 1,000 c.c.; side-cars—600 c.c. and 1,000 c.c.; cycle cars—up to 1,100 c.c. Machines must be equipped according to the new F.I.C.M. rules, details of which appeared in our issue of August 12th, 1920.

Spares to be Declared.

All important parts will be sealed. Spares may be carried, but a list must be made out in duplicate, one of which must be surrendered to the organisers. No other spares may be carried, except sparking plugs, tyres, belts, chains, or chain links. Vehicles with more than two wheels may carry a spare wheel. This must be carried throughout the competition, and if the spare wheel is used the wheel and damaged tyre must be carried throughout the competition.

During the trial competitors must carry armlets, and those who are entrants for the International Trophy must have these armlets coloured according to their countries. The British national colour in this event is green. Two numbered discs must be carried, one on each side of the machine and a number plate in front, which will be clearly visible and free of all obstruction. Each English competitor must be provided with an A.C.U. competitor's licence and an International travelling pass.

Details of the Trial.

The average speed throughout will be thirty kilometres (nineteen miles) an hour, with allowances for difficult sections where the course is of exceptional severity. One and a half hours will be allowed for lunch.

There will be controls at intervals, where a competitor must mark his time-sheets. An allowance of ten minutes ahead of, or behind, schedule time is permitted, but competitors will be penalised one mark per minute early or late beyond this limit. Competitors must also stop at all secret controls when these are encountered, and these same rules apply. Any competitor who is one hour late at a control is deemed to have retired from the trial, and in such case must surrender his number plates. Should a competitor lose his way, he must return to the point where he went wrong, as no short cuts are permitted, but arrows will be arranged at all doubtful points.

After lunch intervals, competitors will start according to schedule, and not in the order of arrival, *e.g.*, a man who is fifty minutes late will have only forty minutes for lunch.

If the packet of spare parts is opened, a declaration must be made to the nearest marshal, who will seal it afresh. Failure to observe this rule will involve a penalty of ten marks for each part not declared.

In the luncheon controls and at the starting and finishing depots, competitors may only replenish their tanks; no work of any kind may be done. There will be special replenishment depots throughout the trial.

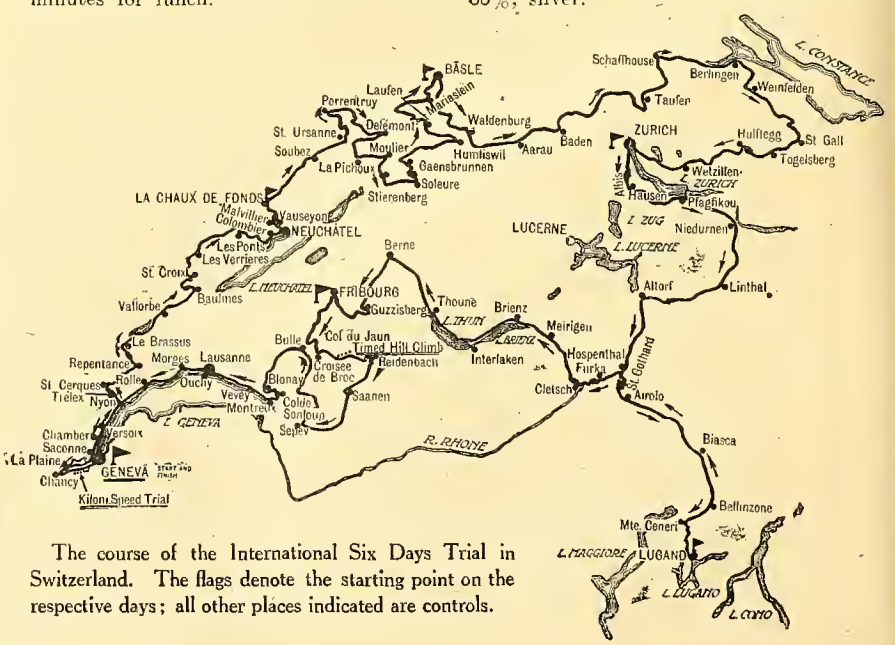
Speed Limits.

All speed limits must be strictly observed. On the last day, the flying kilometre speed test will be on the Eau-Morte road, near Geneva, and each competitor will have to maintain the particular speed designated to his own class. There will also be a six kilometre speed hill-climb on a straight road. Both these events will be electrically timed. Each competitor will have 1,000 marks to his credit at the beginning of the trial.

Penalties.

In addition to being penalised one mark for each minute, early or late, no penalty for being late must exceed sixty marks. For not maintaining the set speed during the speed trial one mark per kilometre under the set speed will be imposed, and as regards the hill-climb one mark will be deducted for every ten seconds under the speed of the fastest man in that class.

Awards.



INDIVIDUAL AWARDS.

250 c.c. class: 75% marks, gold; 55%, silver.

350 c.c. class: 80%, gold; 60%, silver.

500 c.c., 750 c.c., and 1,000 c.c. classes: 90%, gold; 70%, silver.

Sidecars (600 c.c. class): 75%, gold; 55%, silver.

The course of the International Six Days Trial in Switzerland. The flags denote the starting point on the respective days; all other places indicated are controls.

A Six Days Trial on the Alps.—

SIDECARS.

Sidecars and cycle car (1,000 c.c. class): 80%, gold; 60%, silver.

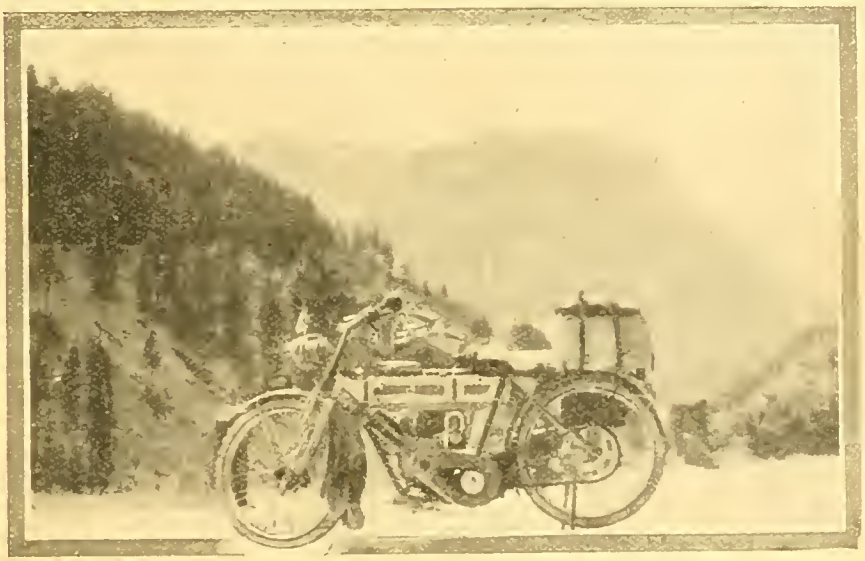
All competitors finishing the trial without loss of marks will gain the U.M.F. special gold medal, and a bronze medal will be awarded to all who finish the trial and have gained no other awards.

As regards the teams of different makes, three machines of the same make must be nominated by a manufacturer or agent twenty-four hours before the beginning of the trial. The awards will be

(a) Silver cup and three silver medals to the first team.

(b) A silver cup and three bronze medals for the second team.

Club teams, or clubs affiliated to one of the national bodies, will be composed of three machines of makes nominated beforehand, and these will compete for the same prizes and under the same conditions of entry.



In the case of a dead heat the winners will be the team having the smallest quotient obtained by dividing the c.c. of the three machines by the number of passengers carried.

The International Trophy

Entries for this award will consist of one team of three riders entered by the governing body of each nation entering the competition. Riders must be of the nationality of that country, and must enter machines made or assembled in that country. Teams must be composed of two solo motor cycles and one sidecar outfit or cycle car. Motor cycles must be of Classes A, B, or C, and the cycle car or sidecar may be in any class.

Insurances throughout the trial are included in the entrance fee. Any protests must be made at latest one hour after the competitor arrives at the end of a section; and fifty francs must be deposited, which will be returned if the protest is upheld.

In the map accompanying these details, competitors must bear in mind that the names of the places are in their French form. A large portion of Switzerland being German-speaking, some of these names are quite different from those by which they are locally known. For example: Schaffhouse, where is the luncheon stop during the third day's journey, is known as Schaffhausen. What we know as the Lake of Constance is called locally the Bodensee. What we know as the Lake of Lucerne is known by the French as Lac de Quatre Cantons, but locally as the Vierwaldstättersee. Finally, the Lake of Thun, shown on the map as Thoune, is known locally as the Thunersee. Intending competitors should, therefore, study their maps carefully.

A British tourist's P. and M. in one of the passes of the Swiss Alps

GLASGOW DISPLAY WEEK.

DURING the present week (January 28th to February 5th) the Scottish Motor Exhibition is being held in Kelvin Hall, Glasgow. This show is only open to motor cars and car accessories; but, in conjunction with local motor cycle traders, most of the leading machines are on exhibition in various showrooms in the city. All Scots and North countrymen who had not the opportunity of visiting Olympia will find the latest models on view as follows:

Alexander and Co., 272-274, Great Western Road: Bat, Clyno, Coventry Eagle, Coulson-B, Diamond, Douglas, American Henderson, Indian, Levis, Matchless, Norton, N.U.T., Omega, P. and M., Quadrant, Rex, Enfield, Velocette, Verus, Wilkin, Zenith, and Morgan.

Ariel Works, Ltd., 81, Dunlop Street: Ariel.

Bell Bros., 238-250, Great Western Road: A.J.S., B.S.A., Edmund, Harley, James, Millford, and Watsonian.

Dickies, Ltd., 222, Bothwell Street: F.N.

Douglas-Deans, Ltd., 74, Great Western Road: Lea-Francis, New Imperial, and Sparkbrook.

General Motors (Glasgow), Ltd., 22, Wilkie Street: Wooler.

Harry Gold, 149, Elderslie Street: Corona Junior.

V. Jennings and Co., Ltd., 86, Mitchell Street: Bradbury, Coventry Acme, Humber, O.K., and Sunbeam.

North British Machine Co., 56-60, Great Clyde Street: Excelsior, Calthorpe, Lincoln-Elk, and New Hudson.

Raleigh Cycle Co., Ltd., 34, Queen Street: Raleigh.

James Robertson, 11, Bath Street: Beardmore-Precision.

Rossleigh, Ltd., 532, Great Western Road: Allon, Martinsyde, Rover, Royal Ruby, Scott, A.V., Premier Runabout, and Scott Sociable.

Rudge-Whitworth, Ltd., 16, West Nile Street: Rudge.

G. M. Smith, 19, West Regent Street: M-L Maglita.

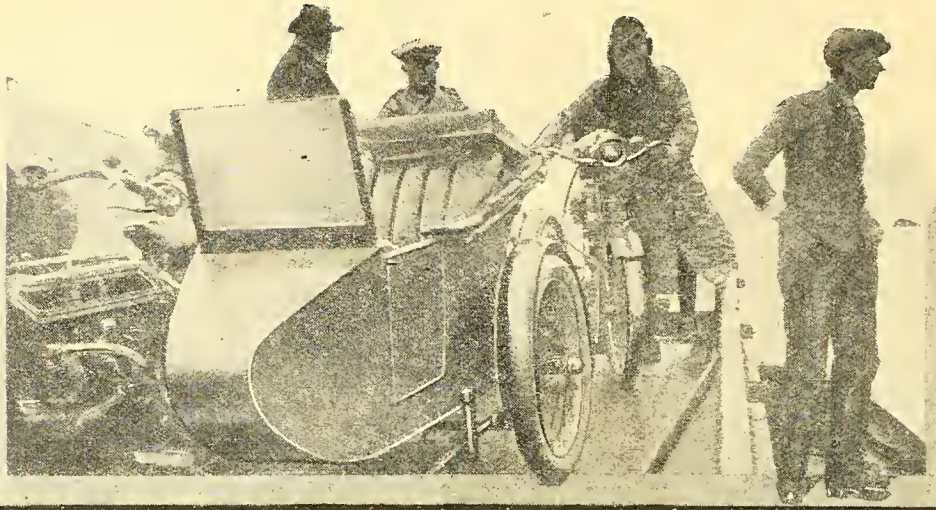
Triumph Cycle Co., Ltd., 14, Waterloo Street: Triumph, Whitley, and Grindlay.

Victoria Motor and Cycle Co., Victoria Works, Dennistoun: Victoria.

Gerard, Wakeham, and Co., 114, Duke Street: Alecto.

John Wishart, 3, Cadogan Street: Sun-Vitesse.

M.C.C. ANNUAL GENERAL MEETING.



LIEUT.-COL. Charles Jarrott, O.B.E., occupied the chair at the annual general meeting of the Motor Cycling Club which took place on January 26th, at Pagani's Restaurant, and in the course of his opening speech congratulated the committee on the terse and businesslike way in which they had presented the report and spoke of the efficiency of the captain of the club, Mr. W. H. Wells.

Mr. Head made a short speech in which he referred to the success of the 1920 events, showing how easily they surpassed those of 1921 as regards entries. He tendered his thanks to the President for presenting the Jarrott Cup again, and to Messrs. Wells, Lester, Elce, Seed, Pettytt, and Messrs. Godfreys for the cups they had presented to the club. The club was in a strong position, and the usual competitions would be carried out in 1921, while the London to Lugano run would receive the committee's consideration for this year. Proposals for a seaside camp were also considered.

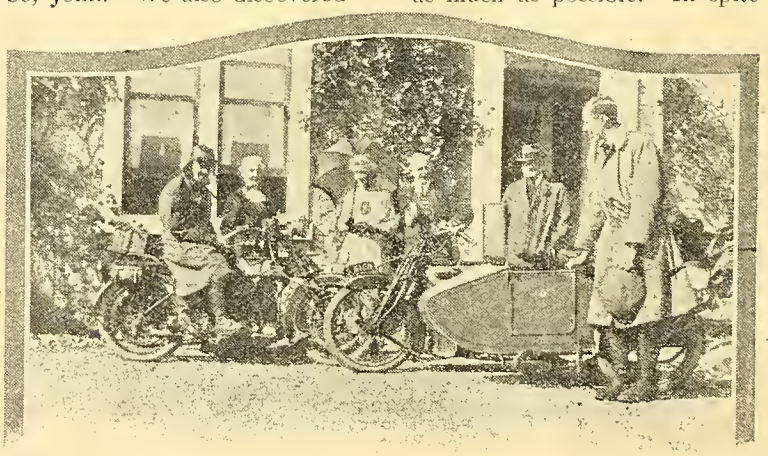
During the ballot for the new committee a general discussion was opened. Mr. B. Marians made a special plea on behalf of lady motor cyclists, urging the advisability of admitting lady members to the M.C.C., and allowing them to take part in the club competitions. Messrs. A. Candler and R. H. Head spoke against this proposal, and eventually it was decided to abandon the idea.

The committee for 1921 has been elected as follows: Messrs. R. H. Head (chairman), A. Candler, E. A. Bridgman, B. A. Hill, W. Cooper, H. G. Bell, E. M. P. Boileau, V. Olsson, E. James, J. Ogilvie, J. A. Masters, and A. C. Robbins.

C11

A TRIO ON TOUR

Being Extracts from the Diary of a Motor Cyclist during a Scottish Tour in Good Company.



ACT I. Scene I. Glasgow.

THE first actors to appear in this drama are discovered trying to get away from Glasgow at 6 p.m. to keep an appointment at Clynder, scheduled at 5 p.m. The younger of the two is dashing round with an oilcan and a handful of grease trying to put it into the greasers, but only succeeding in anointing the exterior of the machine; the elder brother, who is lashing cans of petrol on the back of the sidecar, is protesting that oil is unnecessary, as the bicycle had some four months ago.

When every inch of "cargo space" had been loaded the outfit moved off looking something like a tinker's caravan.

ACT I. Scene II. Clynder.

Arriving at Clynder, only three hours late, we were greeted by a totally undeserved flow of condemnation from our companion-to-be, John. We also discovered that our friends, the Hardies, had been searching the Gareloch in their motor boat for us, which we considered rather pessimistic of them. The "Bulldog" (John's B.S.A.) was reported to be simply "pawing" the ground to get away. We discounted John's impatience; solo men do not sympathise with the responsibility of packing a sidecar.

Fully loaded and ready to leave Clynder.

ACT II. Scene I. Same as Scene II., Act I.

The morning was one of surpassing loveliness. After all, one reflected, Clynder is not such a bad little place. Certainly, but for the urgings of John, we would not have left for many hours. But John would have none of the "drinking in of the beauties of Nature" stunt, and, amidst protests that we were comfortable where we were, he marshalled the cavalcade in front of the house and, after a little work with a measuring tape, a theodolite, and a slide rule, in order to adjust his lens, he took the official photograph of the "meet." Finally, as the clock paused between the fifth and sixth strokes of eleven, we left amidst a chorus of blessings and farewells.

We made fair progress up Whistlefield Road to Arrochar, where we thought it necessary to alter the alignment of the sidecar in order to minimise our load as much as possible. In spite of this, however, the engine was so hot by the time the foot of "Rest and be Thankful" was reached that it was necessary to resort to low gear for the climb; the B.S.A., of course, climbed it easily on second gear.

From "the Rest" to Inveraray was accomplished practically non-stop, as it was downhill most of the way. We had lunch at the Argyle Arms Hotel,

A Trio on Tour.—

which all enjoyed except John, who was greatly annoyed by the inattention of the waiter. The only relaxation permitted us was a walk down the pier to inspect the vessels lying there, then once more we were urged to mount and ride on.

After leaving Inveraray the road is very beautiful; we passed through a fir wood which is alleged to contain some of the largest fir trees in Scotland, and certainly some of them were strongly reminiscent of the picture on the Australian burgundy bottles.

Passing through Dalmally, John spotted a Druidical stone, and insisted on being photographed with the "Bulldog" in front of it.

Leaving Loch Awe Hotel one passes through some beautiful scenery, including the famous pass of Brander, and on arriving at Taynuilt we repaired to the local inn and had an excellent tea.

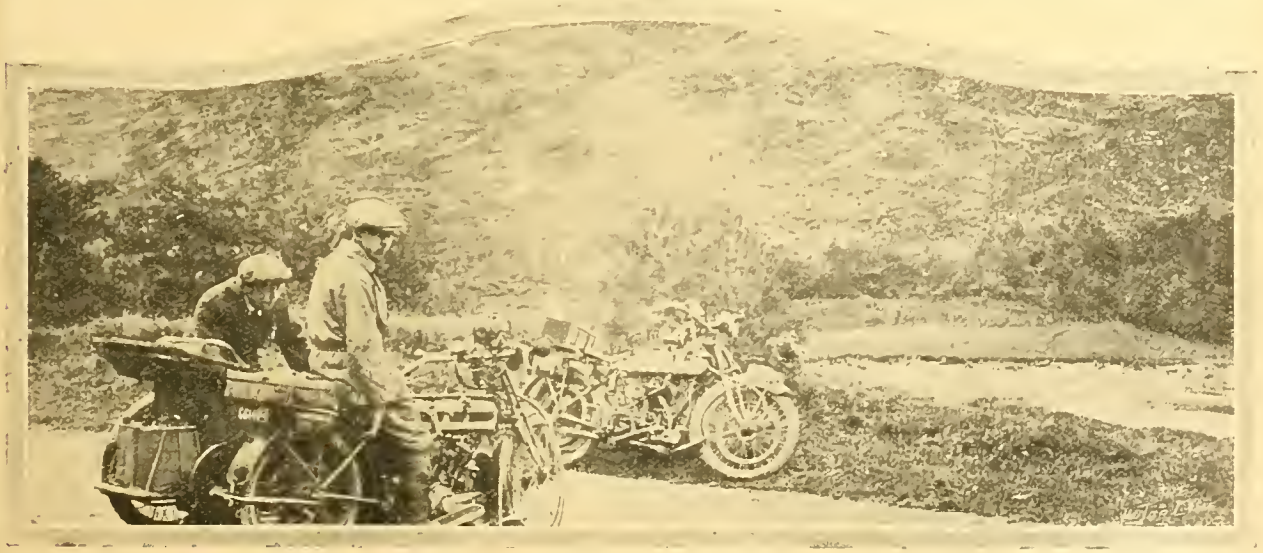
From Taynuilt we dashed on to Connel, where James made friendly advances to the manageress of the hotel, and secured rooms. As the A.J.S. had been running very badly it was decided to overhaul the magneto. On dissecting it, the wire to the condenser was found to be cracked and required soldering.

While working on the bicycles, the owner of a 2¼ h.p. Levis, which was standing in the garage, appeared, and got into conversation. He informed us that he had "coom fra Manchester." He congratulated us on obtaining rooms, and on James explaining that someone had to be put out of a room into a small cottage in order to let us in, he laughed loudly, but changed his tune somewhat on finding out, when we adjourned to the hotel, that it was he who had to transfer.

After an unsuccessful attempt to solder the magneto with the aid of a candle and a piece of copper wire, we took the globe and mantle off the petrol gas bracket in the bathroom, and scraped some solder off one of the water pipes, but, owing to the want of Fluxite, we were baulked again.

One would not think that there would be very much shunting done on the railway at a one-horse township like Connel, but we soon discovered that Willesden Junction is a quiet place by comparison. To make matters worse, the engine which did the shunting kept up such a pressure of steam that it hissed loudly all the time, and whistled on every possible (and impossible) occasion.

The tickets issued at Connel Ferry Viaduct. A person was rated with a dog—fee 2d. The A.J.S. was equivalent to a cow—fee 4 -, and the B.S.A to a pig—fee 2 -.



ACT III. Scene I., and Several Others.

After breakfast John took Tom into Oban on the tail of the "doggie wee bike," where, with the aid of a friendly plumber's soldering iron, the magneto was put to rights.

The glorious weather of two days before had been replaced by a steady drizzle and a dull grey sky. On returning to Connel, and reassembling the magneto, a fine healthy spark was obtained, and the engine ran beautifully. As it was almost lunch time before the A.J.S. was ready we stayed at Connel for that meal.

Our friend of the Levis was preparing to depart. On the carrier of his tiny mounts he had a gigantic bag. An idea of its size can be gathered from the fact that one half of it (it opened down the middle, longwise) contained a two-gallon tin of petrol, half a gallon tin of oil, some tools and clothes, the other half being filled with clothes. How the poor little engine managed to get along amazed us.

On starting off ourselves, we crossed the Connel Ferry Viaduct, being mulcted to the extent of six and sixpence in the process. The tickets issued us were most insulting. A person was rated with a dog, fee 2d.; the A.J.S. was the equivalent of a cow, fee 4s.; but worst

A wayside halt at the foot of Ben Nevis.

A Trio on Tour.—

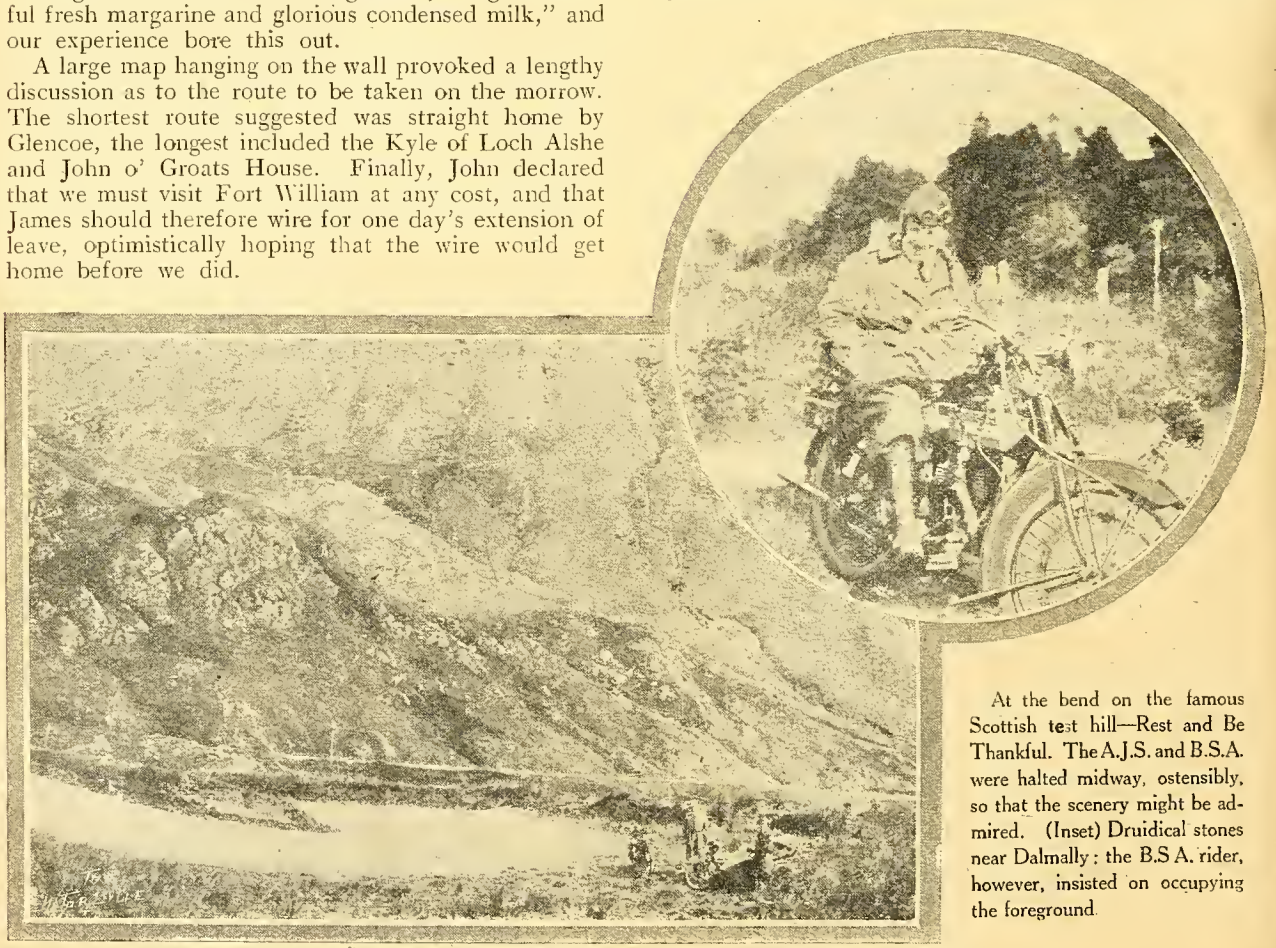
of all was classing the B.S.A. with a pig, fee 2s. During a roadside halt shortly afterwards a large tack was discovered in the front wheel of the A.J.S. John wanted to push on to our destination before repairing the tyre, and finally carried the day, and we proceeded, pumping up the tyre when it went down.

Shortly after this there came on what is known in Scotland as a Scotch mist, and in other parts of the globe as heavy rain. There are few ways so effective of getting thoroughly wet as driving through a Highland rainstorm.

As we were not sure if we should get rooms at Ballachulish, John pushed on. We sorrowfully pushed the A.J.S. back under a railway bridge which happened to be near. An arm of Loch Linnie conveniently placed near the railway bridge provided us with the means of locating the puncture in the tube.

Just as the puncture had been sealed, John returned with the news that he had secured rooms. All the time we were struggling to get the cover on, John kept on eulogising his Bates tyre till we threatened to take it off and strangle him with it.

We arrived at Ballachulish in plenty of time to change into our dinner trousers before dinner (we kept our dinner jackets on, even when under way, as this economised luggage space).



Someone writing of a visit to Ballachulish said, "Being in the heart of the Highlands, we got beautiful fresh margarine and glorious condensed milk," and our experience bore this out.

A large map hanging on the wall provoked a lengthy discussion as to the route to be taken on the morrow. The shortest route suggested was straight home by Glencoe, the longest included the Kyle of Loch Alshe and John o' Groats House. Finally, John declared that we must visit Fort William at any cost, and that James should therefore wire for one day's extension of leave, optimistically hoping that the wire would get home before we did.

ACT IV. Scenes from Ballachulish to Ben Nevis

After breakfast we proceeded on board the Ballachulish ferry boat, which crosses Loch Leven at a point where the banks are only about two hundred yards apart. The following is a brief description of this most rag-time craft. Mounted on the large flat boat is a turntable, which is rotated to bring it end-on to the jetty at either bank, while at the same time allowing the boat to lie alongside the "pier." As the latter is very steep the turntable touches it at the upper side only, while the "seaward" edge of the table is about a foot or eighteen inches above the surface of the jetty. Once the cargo is aboard the turntable is swung round until it lies fore and aft of the hull. As the whole of the tide ration for the upper part of Loch Leven has to flow through this narrow channel, the speed of the current is tremendous; it was given us by a native as ten knots, which we fully believed.

As the ferry is not nearly fast enough to steam against the full force of the current "she" crawls along the shore in most hair-raisingly close proximity to the latter, in order to get the benefit of the slack water. When the ferryman judges he has gone far enough against the tide, he steers for the opposite side. As soon as the boat encounters the full force of the tide it is whirled away like a leaf in a mill-race, but the ferryman has so judged the speed of the tide, that by the time the landing jetty is passed the boat just enters the slack water behind this, and makes

At the bend on the famous Scottish test hill—Rest and Be Thankful. The A.J.S. and B.S.A. were halted midway, ostensibly, so that the scenery might be admired. (Inset) Druidical stones near Dalmally: the B.S.A. rider, however, insisted on occupying the foreground.

A Trio on Tour.—

fast, when practically the same performance is gone through as at the loading.

In the case of motor cycles one end had to be lifted to prevent the crank case fouling the edge of the turntable. A stranger with a Harley-Davidson was also going along to Fort William, as the Highland Games were to take place there that day. On landing at North Ballachulish, the order of leaving was arranged. The A.J.S. was sent on first with instructions to go as fast as it possibly could (there was a nasty insinuation contained in these instructions). John followed, while the Harley brought up the rear. We had hardly gone half a mile when a large Rolls Royce appeared behind the Harley-Davidson, thereby speeding up the whole procession considerably. On arriving in Fort William the A.J.S. people stopped. Feeling they had gone fairly quickly, they expected to get off with a few insulting remarks on their slowness; instead, however, they were assailed with a perfect torrent of abuse in what appeared to them to be Arabic for going so fast. It seemed that the road had been far too loose and rutted for John's liking, and, judging by his comments, he did not seem to have enjoyed the ride at all.

When peace had been restored, we made for the Highland Games. Evidently the promoters of the games knew their audience, for they had erected high screens of pack-sheet round the enclosure. The shilling admittance fee coming on top of a fare of four shillings to cross the ferry was too much for our Scotch blood, so we decided to push on and see Ben Nevis, which was free. We did get some of the "atmosphere" of the games by standing outside, however, as everyone was running about in kilts, while someone inside the enclosure was playing Handel's "Messiah" on the bagpipes.

We proceeded up a small side road towards the Ben. There are few roads in Scotland, surely, which could surpass this one for beauty or scenery. On the one hand was a pretty woodland, while on the other rushed a sparkling river, from the further bank of which rose some of the finest mountains in Scotland. Their tops were wreathed in mist, and though this prevented us seeing the actual summit of Ben Nevis we could make out the "road" which leads up to the observatory on the top.

By general consent the scene was voted magnificent, but we all agreed that, as usual, we had been "done," as we could only see the foothills. James lay at his ease on a grassy bank and kept on telling us that he would have climbed Ben Nevis if it had not been for the mist.

After a long, last look, we reluctantly wended our way back to Fort William, where, the games being over, the shops had opened. Being seized with an economical spirit, we dined at a small eating shop, whose customers seemed to be chiefly fat Highland mothers, with multifarious families, who dished out tea in saucers to their offsprings, and jabbered to each other in Gaelic at a most frightful speed.

After having increased our weight we proceeded to a garage in search of oil and, perchance, petrol. John asked for a filler for his gear box, but the garage proprietor only possessed petrol fillers with wire gauze strainers in them; however, he obligingly knocked the gauze to pieces with several pokes of his large horny finger.

The gallon of oil filled both tanks, John's gear box, all available oilcans, and even the hubs of the wheels so full that the street was slippery with oil, but even then we had reluctantly to leave some of it in the tin. It seems to be a trait in most motor cyclists' characters that they will cheerfully spill half a pint of oil when filling their tank, but it is like losing a tooth for them to have to leave even a drachm of oil in the tin. By the time we had finished filling up fully threequarters of the children in Fort William had collected round us asking questions and passing remarks. To keep down our average speed a little we stopped outside Fort William and gathered some very fine heather with which to decorate the machines.

(To be continued.)

The New "Six Days" Scheme.

Testing a Racehorse between the Traces of a Plough.

IN his otherwise comprehensive article of January 20th, under the above heading, my friend Mr. B. H. Davies somehow overlooks what seems to me an important point, anent machines of over 350 c.c. being compelled to draw sidecars in the next Six Days event.

I had in my possession recently two machines of approximately this capacity. One was a low compression, outside flywheel single-cylinder, and the other a high compression overhead valve flat twin. Both were excellent solo machines in their way, but for real pleasurable riding there was no comparison—the high compression twin being far and away preferable according to my own tastes.

Of these two machines, the single was quite capable of drawing a lightweight sidecar anywhere within the limits of reason, but the other was so essentially a solo machine that not only would it have been a hopeless proposition with sidecar attached, but it would have been absolutely criminal to have imposed such a load upon it. Yet this machine suited me admirably, and it would be foolish to discourage its type.

It may be said that even a solo machine should possess a sufficient reserve for sidecar haulage, but I fail to see the reason of this argument. Would it be any test of a thoroughbred racehorse to sample its pulling powers between the traces of a plough? No, it would merely ruin the racehorse.

Some manufacturers of purely solo machines may be sufficiently bold to stipulate that their guarantees become void immediately a sidecar be attached, and I think that such a stipulation made public by the makers should, at any rate, exempt machines of that make from the imposition the A.C.U. propose to inflict.

The idea does not seem to be a fair one. Obviously such a machine as a Triumph would not be so heavily handicapped by the attachment as would such a machine as the overhead valve flat twin Brough.

H. MORTIMER BATTEN.

CLUB NEWS. (Continued from page 130.)

Newport and County M.C.C.

The annual general meeting will be held at the Town Hall, Newport, Mon., at 7.30 p.m. on February 9th, for the purpose of electing officers and arranging a programme for 1921.

Woolwich, Plumstead, and District M.C.C.

At the annual general meeting on Friday (January 21st) of the Woolwich Club this year's competitions were left to a sub-committee appointed. Mr. T. J. Ross was re-elected captain and Mrs. Hardee captain ladies' section.

North Wilts M.C. and L.C.C.

About fifty members and friends of the North Wilts Motor Cycle and Light Car Club spent a convivial time at the King's Arms Hotel on Wednesday of last week, when, following a supper at which Mr. D. W. Mercer occupied the chair, an informal but helpful discussion took place.

Brighton and Hove M.C.C.

At the first annual general meeting of the above club satisfactory reports of the various activities of the club were received from the sub-committees, and officers for 1921 were elected. A very ambitious programme has been arranged, opening with a fancy dress ball at the Old Ship Hotel on February 22nd. Social runs and competitions are to be a weekly feature.

Grimsby M.C.C.

The winter reliability trial for the Best Silver Challenge Cup was run on Saturday, January 22nd. The course was a short but exceedingly stiff one. Mrs. M. C. Jennison, on a 2¼ h.p. Velocette, was the winner of the Best Cup, club's gold medal, and special prize for the best performance under 350 c.c. Silver medals were awarded to F. Plastow (2¼ Triumph), W. Maltby (4 Triumph), J. Woods (3 A.B.C.), and H. Jennison (2¾ Verus).

Sports Committee medals for meritorious performance were awarded to Messrs. Hercock, Eves, and Burton (4 Triumphs).

Newcastle and District M.C.

Newcastle and District Motor Club has fixed 30th April next as the date of the open Travers Trophy hill-climbing competition. The trophy is a two hundred guineas gold challenge cup, with a £50 first prize.

Leeds and District M.C.

Headquarters of the above club are now at the Albion Hotel, Briggate, Leeds, where there is yard accommodation for members' machines. The adjourned general meeting will be held there on Thursday, February 10th, at 7 p.m.

Bradford M.C. and L.C.C.

A very enjoyable "smoker" was held at the Belle Vue Hotel, Bradford, on Thursday, January 27th, and the members were much indebted to Messrs. Dewhirst Bros., Sydney Firth, and C. C. Cooke for a delightful musical programme. Mr. T. G. Bullus (the club trials hon. secretary) gave a "lecturette" on "Reliability Trial Riding."

Yorkshire Centre A.C.U.

The first annual general meeting was held at the Hotel Metropole, Leeds, on Monday, January 24th, Mr. Norman Longfield presiding. He stated that the centre had been allowed three open events for 1921 instead of two, as originally arranged.

It was decided to hold four Yorkshire Centre events in addition to the three A.C.U. open events.

Wrexham and District M.C.C.

The first annual general meeting was held at the headquarters, Talbot Hotel, Wrexham, on January 28th. Twenty-three new members were proposed and enrolled. The membership and financial state of the club proved very satisfactory. A dinner will be held at 7 p.m. on February 9th at the Wynnstay Hotel, Wrexham, his Worship the Mayor, Ald. T. Sauvage, presiding. Information and tickets (6s.) may be obtained from the hon. secretary, 32, Norman Road, Wrexham.

Cambuslang and Rutherglen M.C.C.

It is proposed to form a club as above. Interested motor cyclists in this neighbourhood should communicate with the secretary *(pro tem.)*, Mr. G. MacGregor, Hillside Terrace, Main Street, Cambuslang.

The Public Schools M.C.C.

Col. Lindsay Lloyd, C.M.G. (the President), occupied the chair at the first annual dinner of the Public Schools M.C.C. since the war, which was held at the Café Royal, Regent Street, London, W.1, on Thursday last. It was a very jolly affair, and quite informal.

Wellingborough, Rushden, and District M.C.C.

After a lapse of five years the Wellingborough, Rushden, and District M.C.C. was restarted at a meeting held at the Queen Victoria Hotel, Rushden, last week. A temporary committee, consisting of Messrs. H. Macleod, C. Ette, W. Watts, W. H. Mason, S. R. Edwards (Wellingborough), and Claridge Chettle (West Rushden), were appointed to carry out preliminary arrangements, with Mr. W. A. Fathers honorary secretary *pro tem.*

Coventry and Warwickshire M.C.

The Coventry and Warwickshire M.C. held its annual general meeting last Friday, when activities for the past year were satisfactorily reported. For 1921 Col. Cole, managing director of Humber, Ltd., has been elected president, while the officers are: Hon. sec., J. F. Spencer; captain, A. McGowran; treasurer, C. H. Elson; committee, G. E. Roberts (chairman), F. Hulbert, A. Elson, S. Wright, M. W. Danks, M. Sampson, W. Brandish, E. J. Appleby, G. I. Francis, H. L. Davey, W. A. Atkin, G. L. White, J. Bachelor, and E. Barnett. The subscription has been raised to 12s. 6d., and the entrance fee to 7s. 6d. The opening run will be held on Saturday next, meeting at Davenport Road, Coventry, while a twenty-four hours trial to Torquay and back for the Golden Goblet is being planned for June 18th.

LIVERPOOL-EDINBURGH TRIAL RESULTS.

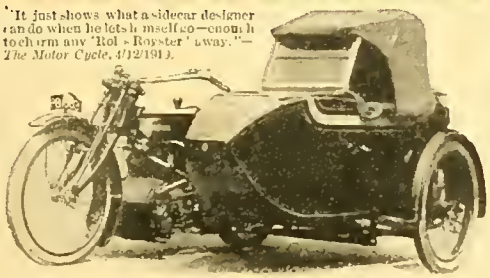
QUITE a high percentage of the thirty-seven starters secured gold medals in the recent two-day winter trial of the Liverpool M.C. from Aintree to Edinburgh and back.

The Horsman Cup for the best motor cycle performance cannot be awarded, as both Hugh Gibson (8 Royal Ruby sc.) and H. F. Brockbank (8 Blackburne sc.) qualified; the tie will be run off by arrangement subsequently. G. F. Burns, riding a new 3½ h.p. T.T. Sunbeam, secured the Triumph gold medal for the best single cylinder performance. His riding was very consistent, and the success of this machine on its first appearance in a club run bears out its promise as a super-excellent sporting solo mount. A special prize for the best performance of a 350 c.c. machine was secured by F. Highfield (Beardmore-Precision).

GOLD MEDALS.—Hugh Gibson (8 Royal Ruby sc.), G. Roddick (8 Zenith), S. V. Banner (8 Sunbeam sc.), G. F. Burns (3½ Sunbeam), J. G. Collins (6 A.J.S. sc.), H. F. Brockbank (8 Blackburne sc.), J. L. R. Jensen (7-9 Harley sc.), J. Lee (7-9 Indian sc.), D. G. Prentice (8 Morgan), J. H. Green (6 Martinsyde sc.), H. Karslake (5 Brough), and S. Parker (8 Matchless sc.).

BRONZE MEDALS.—F. Highfield (2¾ Beardmore-Precision), N. C. Slater (3½ Norton), M. Deeley (4 Triumph), S. Bartley (6 A.J.S. sc.), and F. Gunton (2¾ Dalton).

A ROUND THE COAST TRIAL FOR 1921?



THERE is a very large section of the community which considers that the time has come when the public should be shown what a motor cycle can do, instead of its few failures being emphasised, as is usually the case in big competitions.

Undoubtedly the best way of carrying out this propaganda is to arrange a long distance trial in which all the machines will pass through various important centres on schedule time so that the general public may see how reliable a mount is the modern motor cycle.

With this in view, the Birmingham Motor Cycle Club proposes to organise a "round the coast" trial lasting thirteen days and covering a distance of approximately 2,300 miles. At present the idea seems to be receiving very favourable comment.

Further great Reductions in
MOSELEY
TYRE PRICES

MOSELEY Motor Cycle Tyres have always been sold at the lowest possible price consistent with the highest quality and workmanship. A further fall in the price of raw materials enables us at once to pass on the benefit to our customers.

Moseley Motor Cycle Tyres are now moulded in the form they take when inflated on the rim, with the result that the labour of fitting on the rim is reduced to a minimum. The beads are also specially strengthened to avoid rim cutting.

These improvements are further evidence of the constant watchfulness and effort of Moseley to serve the motor cyclist's interest.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1 %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

The Indomitable

Peugeot

QUADRILETTE

—on a gallon of fuel will run 50-60 miles (tested).

But that is only one of its merits. THE "QUADRILETTE" is a worthy successor to the 'Baby" Peugeot but faster, livelier, and full of "vim."

Easy to start, easy to drive, it has the speed and low-running costs of a Motor Cycle, with the added comfort and freedom from trouble of a £1,000 Car.

An Ideal Little Car for a Lady.

The PEUGEOT QUADRILETTE is a product of the Largest and Most Famous Motor Manufacturers in the World, and represents all that is best in Workmanship and Finish.

PRICE, complete with Two-seater Body, Hood, Screen, Three Lamps, Five Wheels and Tyres, complete Kit of Tools.

£298

IMMEDIATE DELIVERY.

A TRIAL RUN on the NEW PEUGEOT QUADRILETTE four-cylinder will convince you of its many Sterling Qualities.

Catalogue with complete specification free on request.

PHILIPSON'S

PATENT AUTOMATIC GOVERNOR

PULLEY

Don't Scrap an old Engine,

but give it a

NEW LEASE OF LIFE

by fitting the

World-famed Philipson Pulley.

Entirely Free from troublesome and weighty complications—only two working parts — no levers, rods, wheels, etc., to worry about. Simply takes the place of the ordinary pulley. One nut secures the complete gear to the engine. Can be fitted without any alterations to most direct belt-driven engines in a few minutes.

For hill-climbing it is unsurpassed. Makes mountaineering easy.

Cycle Cars in Reliability Trials.

AT last post-war four-wheeled cycle cars are to be allowed to compete in open reliability trials on level terms with other vehicles which appeal to those interested in economical motoring. We have urged in these pages that the Royal Automobile Club hand over to the Auto Cycle Union the control of the light four-wheeled vehicles of motor cycle type.

While the R.A.C. has not yet quite fallen in with this suggestion, it is distinctly encouraging to know that the parent body will permit the A.C.U. to assume control in occasional trials. The first of these is the open one-day event now being organised for April 27th, *when all types of motor vehicles which do not exceed 772 lb. in weight will compete together.*

We have already clearly shown the necessity for all classes of vehicles which interest a given public competing together in public trials, and we have suggested that the desirable limits for four-wheelers to be described as cycle cars are 1,100 c.c. engine capacity, and 8 cwt. maximum weight.

In the forthcoming A.C.U. spring trial this suggestion has been followed as regards engine capacity, though the weight limit has been fixed tentatively at 350 kilos. (772 lb.). This weight limit has been introduced in order to comply with international rulings, and therefore has behind it a sound reason. At the same time so long as 8 cwt. is the limit for three-wheelers in the taxation scheme any other definition will have its drawbacks.

From now, it may be said that all four-wheelers are catered for by the R.A.C. and the R.A.C. and A.C.U. jointly; but the international definition automatically rules out several promising propositions of the three-wheeled class which weigh between 350 kilos. (772 lb.) and the 8 cwt. fixed by the Government for taxation purposes.

Cycle cars of both types have now reached a stage of development in which they deserve every encouragement, and if by successes in open trials they compare favourably with sidecars as regards reliability, economy, ease of control, and general utility, their future is assured. Clearly, the best way of attaining this end is for the control of all such vehicles to pass into the hands of the A.C.U.

Manufacturers to Support Trials.

TO a certain extent the attitude of manufacturers towards open trials forms a convenient method of testing the pulse of the industry. Each trial represents a fairly heavy expense to the manufacturer who supports it wholeheartedly, and this expense can only be recouped by the prominence which his machine attains.

Considering these circumstances in conjunction with the present state of the trade, the pessimist might be led to expect but meagre support for 1921 competitions. It is encouraging, therefore, to learn that the Manufacturers' and Traders' Union has decided to support the thirty open competitions which have been sanctioned by the A.C.U. A note of caution is expressed in the reservation that no event of more than one day's duration will receive trade support; but this is a policy of wisdom, since the expenses incurred in a two-day trial are usually much more than double those of a one-day event. Of course, support will be forthcoming only if the regulations and route are approved.

With regard to the more important events of the year, the Tourist Trophy Races have already been sanctioned, and it is most probable that the Scottish Six Days Trials and a Scottish speed event will receive support. The Manufacturers' Union is at present negotiating with the governing body with regard to the A.C.U. Six Days Trials, though we gather that there is little chance of a disagreement. It is the policy of the Union to assist the governing body throughout its programme, but certain difficulties have occurred concerning the selection of stock machines for the A.C.U. spring one-day trial. These difficulties are perfectly genuine, but we hope and believe that they are capable of a solution satisfactory to all parties.

An index to the advertisements in this issue will be found on the page facing the back cover.

OCCASIONAL COMMENTS

BY "IXION"

Benzole.

I IMAGINE that if unlimited supplies of benzole were procurable, even at petrol prices, few of us would trouble the petrol syndicates any longer. Personally, I use benzole whenever the above conditions are fulfilled. But if one is travelling about, or chances to live in a remote corner of England, it often proves impossible to get any kind of benzole; and if benzole happens to be obtainable, it may not be the brand or quality for which the carburetter is adjusted. Three times in the last month I have been tuckered up by the above difficulties. In each case an engine was concerned which had rather a high compression ratio, and suffered from detonation when heavy petrol was the fuel. On any petrol short of the aviation grade, the engines knocked rather badly. To quote examples, one of the 'buses was a 1920 G.N. with the Capac carburetter, which admits of very rapid adjustment to suit various fuels. On petrol it hesitated in accelerating, knocked when picking up, and behaved abominably on hills; on benzole it behaved like a stroked kitten. Requests for benzole at west country garages during a holiday trip provoked the information that "there is no benzole west of Bristol." I don't suppose this is true, but it indicates that the benzole organisation has failed in its early promise.

The Chief Need of the Cycle Car.

FROM a motor cyclist's standpoint, I think we must admit that the best cycle cars, such as the G.N. and the Morgan, already rank as formidable competitors of the sidecar combination, however "de luxe" the latter may be. The cycle car is, however, far more than a potential rival of the sidecar; it also threatens a great offensive on the light car, especially since the price of the latter has shot up to £450. From the small car standpoint the average cycle car is still deficient in one vital respect, viz., the manners of its engine. In point of balance, silence, and exhaust note, the V twin is unquestionably a very crude unit when it is contrasted with the vertical four-cylinder or with the flat twin. Motor cyclists evince no prejudice against the V twin—they are used to it; they accept its failings because they appreciate its merits. On the other hand, new vehicles are gradually appearing which have affinities with the cycle car and yet embody engines which do not dismay a small car man. The flat twin Rover is the cheapest example in this galley. At a far higher cost we meet the flat twin A.B.C.—which is far too refined a chassis to be termed a cycle car; and the American Cotay, which I have not yet seen, and which mounts a four-cylinder air-cooled Cameron engine. If the air-cooled flat twin or line-ahead four-cylinder can be turned out at the same money as a V twin, the cycle car of to-morrow will make vast inroads into the light car market. If I were producing a cycle car, I should try to secure the reduction of vibration, the increased silence and the smoother exhaust note which such engines afford, so that I might draw my customers from the ranks of small car men as well as from motor cyclists.

Engine-starting on Cycle Cars.

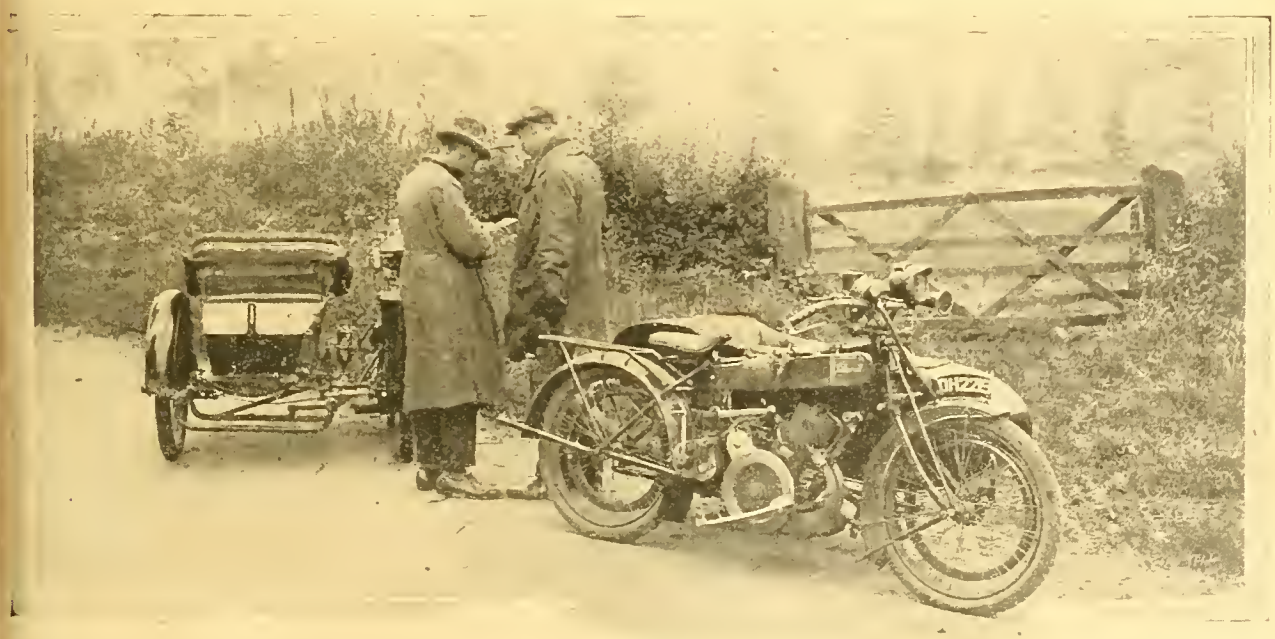
ONE will accept many minor inconveniences in order to save £250 in initial outlay and a proportionate sum on the weekly upkeep. It is for this reason that cycle car owners put up with the annoyance of detachable starting handles which have to be unearthed from the boot whenever the engine is accidentally stopped. One criticises the detachable starting handle not because it is a nuisance, but because it is an unnecessary nuisance, which can be obviated by a little ingenuity and a very trifling expenditure. I am not pleading for electric starters on cycle cars—many good authorities hold that they will shortly become obsolete on the cheaper small cars. They cost a lot of money, and it is common knowledge that they give quite a lot of trouble. One of my *Autocar* colleagues owned three £500 cars last year, and I notice that his starter switch is usually thrown out of action (as a precaution against meddlers) by having its push button packed up with a collar. A well-tuned cycle car engine, whether it be a V, a flat twin, or a bijou four, is delightfully easy to start on the handle, and particularly so if it is a flat twin or a four (hence the popularity of these types). All that is wanted is either a handle on car lines, mounted permanently in position, or a pedal starter such as is used on the Horstmann small car. To sum up, a large output is essential to a cheap cycle car. The maximum output will only sell if appeal is made to impoverished small car men as well as to ambitious motor cyclists. A nice-mannered engine and convenient engine starting are essentials if the small car man is to be drawn into the cycle car fold.

Weight and the A.C.U.

IN the first big motor cycle reliability trial ever organised in this country, horse-power was unlimited, but the overall weight of a machine was not allowed to exceed 170 lb. The pundits in question

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

Occasional Comments.—



were the Automobile Club, which had not then become Royal. To-day the Auto-Cycle Union, which has yet to become Royal, organises a T.T race for 1921, and as last year will limit the horse-power, but not the maximum weight. This reversal of policy gives one furiously to think. We must admit that the A.C.U. has its hands partially tied. If it organises a race under conditions which the trade disapproves, it will not secure entries. If it accepts conditions which annoy judgmatic users and irresponsible scribblers like myself, it will get badly heckled when it faces its constituents. It is between the "devil" of the trade and the "deep sea" of the motor cycle public. Moreover, a race is not on all fours with a reliability trial; and if six aspiring lightweights broke their front forks when scrapping madly down Snaefell, the Island course might get closed to us. But a race for lightweights in which there is no weight limit is an idea which only Lewis Carroll could handle satisfactorily. I note that in the first trial, alluded to above, *no* machine weighed more than 170 lb.

The F.N. Kick-starter.

THE four-cylinder F.N. has a kick-starter of the usual radial type, but mounted across the track instead of in line with it as the British practice goes. I rather fancy this setting may be worth further attention. After several years of "copy-my-neighbour," designers are beginning to study kick-starters anew. The Show revealed several excellent tendencies—increased leverage, interconnection of the starter and valve lifter, etc. Of course, you *can* start any old engine with *any* old kick-starter. But, at best, the required foot action is not natural; and a good designer will ease it as far as possible. Here is a common oversight. With a solo machine, the kick-starter is sometimes used with the machine on the stand and sometimes with the wheels on the ground, *i.e.*, in positions differing in height by several inches. It is seldom that the action is pleasant under both circumstances.

Lamps in Town and Country.

THE magnates of the Metropolis are naturally obsessed by the problems of street illumination in cities and suburbs: they quite fail to realise how futile most of their laws are in rural areas. When I spend a holiday in the country, I learn to rely on my own lamps and on nothing else. Over large areas of Britain the density of the police is much less than one bobby per ten square miles, and the law is ignored accordingly. In such districts all road laws are more honoured in the breach than in the observance, except by motorists. The carter and the cyclist represent short distance traffic; familiar with the local constable's timetable, habits, and personality, they do not trouble to light their lamps unless they are sure to meet him. If they make a miscalculation and meet him, there is seldom a prosecution. Robert, perhaps, calls round next week to buy a little chicken food, and no more is said. The motorist is similarly free, but owing to the speed of his vehicle and, perhaps, also to the fact that his longer journeys cause him to lose touch of Robert's movements, he is generally law-abiding. Anyhow, the net result is that in rural areas it is essential to the public safety that motors should have long-beam lamps. The solution of the problem is a scientific device for eliminating glare, not a Prussian and senseless reduction of light. In urban districts, where the police are thick on the ground and all road users keep the law, a long beam is quite unnecessary. The total area of such districts is a relatively small portion of the country, however.

LOST! Motor cyclists generally have a very good sense of direction, but sometimes the winding lanes in an unknown district lead them back to the starting-point. Nevertheless, lane exploring has a fascination of its own. The machine in the foreground is the experimental Dunelt outfit.

A Trio on Tour

Being Extracts from the Diary of a Motor Cyclist during a Scottish Tour in Good Company.

(*Concluded from page* 147, *Feb. 3rd.*)

ARRIVING back at the ferry we found a large two-seater motor car waiting to cross. There was, however, no sign of the ferry leaving the other side.

Dressed in the inevitable waterproof there was a big man standing on the quay, gazing disconsolately at the water with an air of resigned patience suggestive of Noah standing on Mount Ararat waiting for the flood to subside.

When at last the ferry arrived and unloaded a victim in the shape of a motor, there followed tremendous excitement (on the part of the occupants) while the large coupé was being shipped, the owner finally getting to the seaward side and pushing the car as if to keep it out of the water.

We Meet a Fellow-traveller.

At length we pushed our machines aboard, and had as a shipmate a very ancient crock with a very high sidecar. [For convenience we will in future refer to this outfit as the Kangaroo.]

The driver explained that he had come from Manchester (he said it like that, and not "coom fra Mannchesster," as might be supposed), and had been all round the North of Scotland, and had no trouble till that day, when he had had two blow-outs (in his rear tyre).

Arriving at the south bank we gave him a push off and followed him after a short interval. Getting away quickly from a given spot is not our speciality, and consequently it was some time before we caught up the Kangaroo, which, slow as we are, we eventually did. He was stopped by the roadside at the top of a small hill cleaning his plug. When he was ready we gave him a hearty push (his only method of starting), and again followed in his wake as far as the top of the next small hill, where the Kangaroo gave a few consumptive coughs and came gracefully to rest. The driver would have carried on repeating the plug cleaning process indefinitely, but an examination of his machine revealed the fact that his spark plug was being short circuited by the carburetter control wires touching the plug top. We tied these back, and he had a short trial run, his lady passenger following him on foot loaded with rug, travelling, one; proof, water, one; basket, luncheon, small, one; scarves, parcels, petrol tin, etc., lot, assorted. We also trailed after the "man from Manchester," and helped to load the passenger and dunnage into the sidecar, and gave them a very hearty push off amidst a chorus of thanks and good-byes. It proved only to be an *au revoir*, however, as shortly afterwards, on topping a rise, we saw him in a dip in the road, climbing the hill on the further side. We judged he would be over the top by the time we reached the bottom of the dip, and so we dashed down in order to make a top gear climb, but unfortunately the Kangaroo man having reached his bottom gear ignominiously konked out half way up the hill and started to run backwards.

Involuntary "Stunting."

For a moment it looked as if we would give him a violent help up the hill, but James cleverly looped the loop sideways into the ditch and the Kangaroo, which had by now gained considerable velocity, flashed over the spot where we had been a second before. When near the bottom of the hill it occurred to the man to turn the machine into the steep bank, which he did, with the result that the back wheel mounted up the grassy slope, while the sidecar "nose" dived

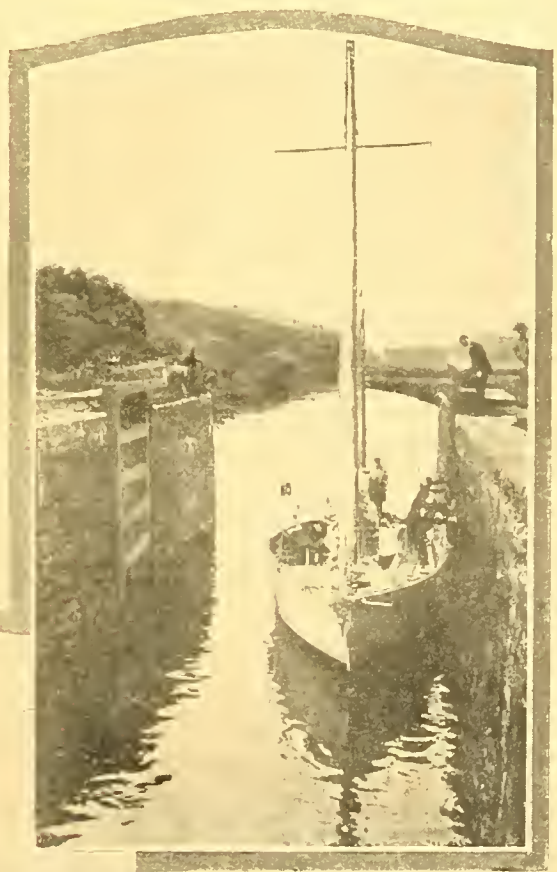
A Trio on Tour.—

on the road, but the whole contraption did not turn turtle (as it should have done by all the laws of dynamics).

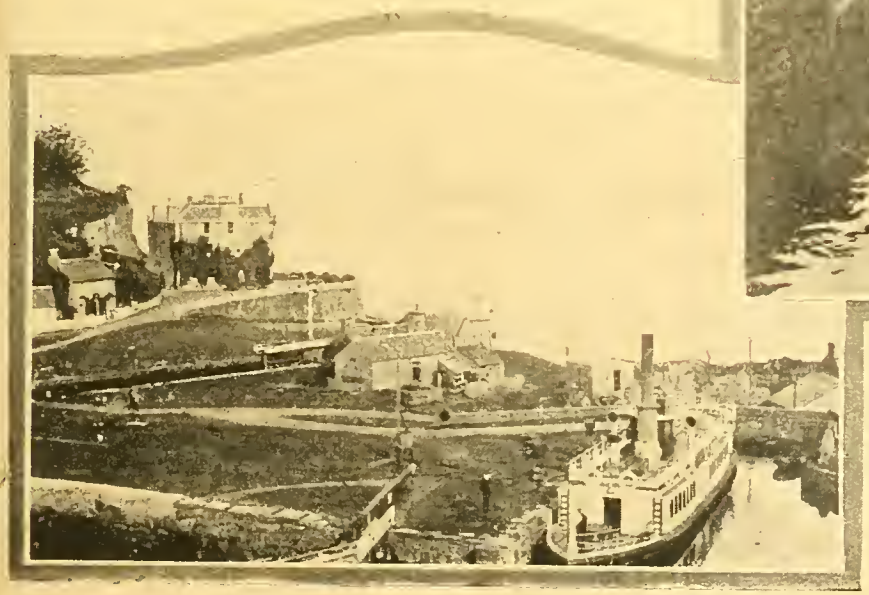
The lady extricated herself and her luggage with some difficulty (we noticed that she never left the sidecar without taking her luggage with her), and we pushed the outfit to the top of the hill. The trouble on this occasion seemed to be the steepness of the hill, combined with overheating of the engine. This time we gave him an *extremely* hearty push off.

We followed him within "visual" distance, as they call it in the Navy. On closing up somewhat on the Kangaroo we were astonished to see sheets of flame belching forth from its carburetter and trailing aft in long streamers of light. This did not retard the machine, and the owner, no doubt congratulating himself on the sudden increase of power, was blissfully unconscious of the fact that he would have been safer sitting on the top of a volcano. We dashed up and hollooed to him, and when he saw the flames he immediately "stood on everything," locking his back wheel, and thereby nearly ejecting his passenger.

"A Little Knowledge is——"



The lady alighted with alacrity, seized her usual burden, *i.e.*, luncheon basket, rug, scarves, and petrol tin, and "hit the trail at speed" for the next parish —with the man in pursuit, as he wanted the rug to extinguish the flames. The fire was eventually got under control, but the machine looked worse than ever, if possible. Certainly it had not improved its appearance, while the driver's coat had several new ventilation holes in it. He explained that his engine had been misfiring before the machine caught fire. His contact breaker was therefore detached, much against his will, and examined. The fibre bush of the rocker arm was found to be swollen, and was reduced with emery paper. John remarked that it was a curious fault on a machine which had been in use so long.



The driver's reply fairly took our breath away; he said he did not think it had much wear; he also propounded the theory that the fire had been caused by the magneto missing one or two sparks, and the next time it sparked, the missing sparks, which, according to his theory, the magneto had stored up, caused such a rush of current that it had set fire to the carburetter!

While James and John were still lying with their foreheads in the damp grass, the man had a trial run without his passenger, after which Tom collected the lady and her luggage and loaded them into the sidecar and once more helped to push the Kangaroo along the road to start it.

The fire seemed to have improved their engine somewhat, but, by and by, we caught up with the pair again, stuck on a hill with their engine very hot. Again we pushed them off, muttering things to ourselves. When they had got out of earshot, we held a council of war and decided to try and induce the pair to stay the night at Port Appin Hotel, which would allow us a clear run to Connel.

We hadn't long to wait for an opportunity to put our scheme into action, as a cloud of blue smoke on

Left. Everyone who knows the Crinan Canal will be familiar with the little "Linnet" shown here preparing for her journey to Ardrishaig.

(Right) Passing through one of several locks on the Crinan Canal.

the next hill proclaimed the presence of the Kangaroo. If the manager of the Port Appin Hotel could have heard how we boomed his hotel to the Kangaroo man, he would have appointed us as advertising agents forthwith. We praised the view, the food, the comfort, and pointed out that it was the spot *par excellence* in which to spend the night. Just when we thought we had him convinced he mentioned the fact that he had booked rooms at Dalmally, and hoped to reach there before dark. John was the first to recover his breath, and proceeded to explain that the roads from Port Appin to Dalmally were amongst the worst in the kingdom, and that Dalmally was at least eighty miles away. We talked so loudly and with such feeling that at last he said he would try Port Appin. We followed him very closely when he got under way, until he reached the gate of the hotel, where he pulled up and started speaking to a man who had come out. There is a steep hill at this part of the road which we went down "all out," and as we dashed past we shouted a cheery "You're all right now!"

Impromptu Wireless.

Spurred on by the thought that they might be following us we managed the next ten miles non-stop, when we felt compelled to give the machines a rest.

Then on again in our whirlwind style. The road at this point was beautiful in the extreme, winding round the very edge of Loch Creran. The ten miles to Connel were covered in record time (for us)—the average being over 25 m.p.h.

As there is an hotel at each end of the bridge, and it costs 4s. for each machine to get from one to the other, we decided that one of us should walk across the bridge (fee 2d.) and ascertain if rooms could be had at the south side hotel. We tossed up who should go and James lost. He took a pocket flash lamp with him to "Morse" the result of his investigations.

The arrangement was that if we received a favourable message, we were to light a small fire as a reply and then join him on the south bank.

In order to acknowledge the signal smartly, we decided to make a fire with petrol, and so got out the spare bottle from the A.J.S., and as soon as we had read James's message we dashed a quantity over some dead thistles on the bank. We put rather too much on, for though some of it evaporated while we endeavoured to strike a match, on a rotten matchbox John produced, when we did apply the light half the bank broke out into a roaring sheet of flame which would have acknowledged a signal from Glasgow.

From our point of view, the plan worked splendidly, and we were saved the time it would have taken James at least half an hour to walk back to us.

We had the same room as before and slept quite soundly in it in spite of the fact that its number was thirteen. Just to cheer us the railway company kindly provided their usual midnight demonstration of shunting and whistling.

ACT V. Scene at Oban and Crinan.

We got under way about 10 a.m. and set out for Oban. We hadn't gone far when we passed our friend on the Kangaroo also making for the "Charing Cross of the Highlands." His machine was running as sweetly as two Fordson tractors having a fight on the corrugated iron roof of a tin can factory. Needless to say, we did not fall in behind him, but dashed past at our very utmost speed. Nevertheless, he was only about one minute behind us when we stopped at Oban. We immediately asked him which way he was going. Fortunately he was still making for Dalmally, so we didn't have to alter our route.

His parting words were to the effect that they might see us in Inveraray. As we were scheduled to arrive a day after them, we didn't see how we could, at the time. However, he proved to be right.

Leaving Oban, we continued south over most atrocious roads, through the Pass of Melfort.

About half a mile from Crinan, we took the wrong road and did not discover our mistake until we had covered nearly two miles, including a long hill about a mile long. Arrived at Crinan, James went to try and get rooms at the Hotel. He must have a very charming way with hotel keepers, for although the hotel was full, they dashed around and made up beds in rooms over the garage, evidently meant for the chauffeurs. The garage accommodation here was the best we had come across on our trip.

ACT VI.

So many people advised us to visit Loch Sween, on our way home, that at last we decided there must be something special there, and altered our route accordingly. We made for Tayvallich, but the road was so rough that it took considerable coaxing on John's part to keep James from turning back. John, who had visited the place while on a voyage in a yacht, remembered a small road across the peninsula which finally landed us at a very small place called Arisaig.

We returned by the same route (the only one) to the Crinan Canal, and stopped above Crinan village on a very tempting blind corner, whence we watched the efforts of a cormorant to swallow a large flounder which it had caught. It could get the flounder half-way down its throat, which caused its neck to become flat instead of round. Remembering the annoyance caused by a single fish bone stuck in one's throat, our sympathies were all with that cormorant.

While we were watching these digestive troubles, a large yacht passed up the canal, on its way to Ardrishaig, and we decided to push on to Cairnban and photograph it as it passed through the locks. We managed to get there first, as the yacht had engine trouble on the way, and we watched it go through the first lock, photographed it, and even went as far as to help by leaning against the beam for opening the gates. We noticed the usual bunch of heather tied to the rigging of the yacht.

Proceeding on our way, we ran non-stop to about a mile from Lochgilphead, when John got into the sidecar and Tom took the B.S.A.

Near Furnace, James suddenly announced that he was going to have a bathe, declaring that this was one of his objects in coming the trip. Tom followed his example. Both were much troubled by midges while undressing. When the bathers had waded in about knee-deep, John decided that he must take a photograph, and insisted on us standing up to our knees in icy water, and being devoured by midges above the water line, while he carefully measured off the distance in order to focus his patent lens.

A Trio on Tour.—

After the bathe, and once more under way, we decided to take the shore to Inveraray in preference to the main road. A warning from a native in Furnace that there were a "wheen braes" on the road proved very correct, the worst "braes" being a gentle slope of about 1 in 2, in climbing which we had to pass a horse and cart and a horse solo, also two open gates.

A few hundred yards from this semi-precipice we "flushed" a black cock, and later a grouse, only missing running over them by about five feet.

Presently we came on a parting of the ways. A fairly decent road went to the right, but was marked "Private." To the left there was a farm track rather deeply rutted, while straight ahead stretched what appeared to be a dry river bed. Naturally we took to the left, and after making one or two sudden bends the road brought us into a beautiful little sylvan glade.

Right About Face!

John had discovered that we were on the wrong road, so we stopped at the end of the glade. As we should have gone along the river bed already referred to, we retraced our wheel tracks thither. John, who was coming along behind, was engaged in a spirited encounter with a collie dog, and in his efforts to get in a kick he did not notice, until he was almost on it, that the sidecar machine was stopped with its back wheel buzzing round in a deep rut. Looking back we saw him frantically stamping on pedals and moving handles, all the time endeavouring to kick the dog.

Almost the first person we met in Inveraray was the passenger of the Kangaroo. Shortly after we met the driver also.

He told us that he had broken the key of his timing gear the night before and had been towed into Inveraray by a Ford.

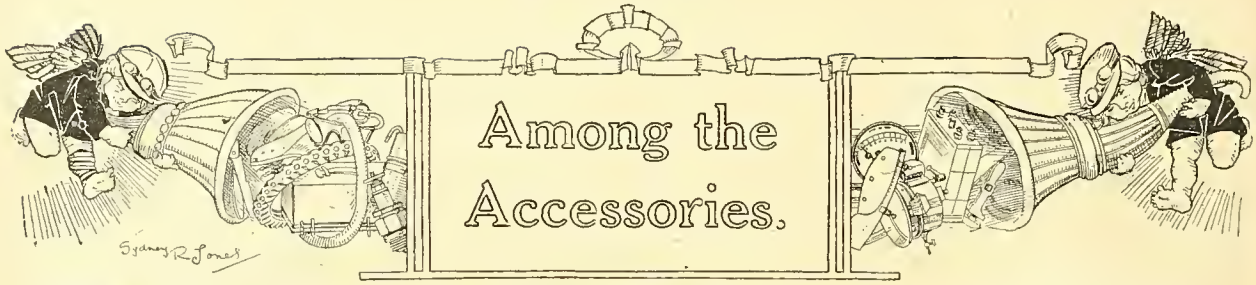
After bidding farewell to the Kangaroo people we ran from Inveraray to the hairpin bend on "Rest and Be Thankful," non-stop, which we considered pretty good, even though we are accustomed to long non-stop runs! During this stretch the A.J.S. gave one or two demonstrations of frightfulness, but climbed the "Rest" easily (on bottom gear).

As the A.J.S. had still about forty miles to do we didn't stay long on the "Rest," but hurried on to Arrochar. On a previous run John had packed all his luggage in his own bag and found at the end of the day's run that the vibration that the bag was subjected to on the carrier of his bicycle had blunted a packet of safety razor blades, set off a box of matches, and done other minor damage to the contents. As a result of this experience, all the hard and breakable goods in John's bag had been packed in our portmanteau, while soft goods had been transferred therefrom to John's case. This necessitated a complete unpacking of both bags and a sorting out of the contents on the party splitting up.

Home at Last!

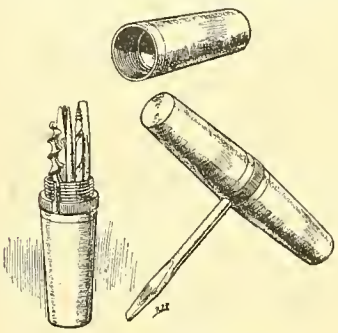
When things had been straightened out a bit, and Arrochar had once more resumed something of its usual calm, there was a very touching scene while we took affectionate farewell of the B.S.A. and its rider.

Once more on semi-respectable roads, the A.J.S. made very good time to Dumbarton. By the time Paisley was reached darkness was falling, and we did not want to stop to light up, so we fished out a small electric flash light and switched it on whenever we thought there would be any policemen about. Glasgow was reached at 9.30 p.m., two hours after leaving Arrochar, which we thought pretty good.



[Curtain.]

J.F.H.

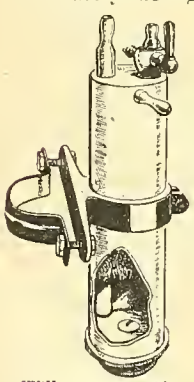


ON THE EDGE OF THE FOREST OF ARDEN.

Reputed to be the centre of England—Meriden, on the main London-Holyhead road, and located between Coventry and Birmingham.

A Waistcoat Pocket Tool Kit.

What motor cyclist has not at some time on the road found a need for a corkscrew, gimlet, bradawl, or a pair of tweezers? The tool kit illustrated is contained in a little case which forms the handle for five of the six tools in the kit,



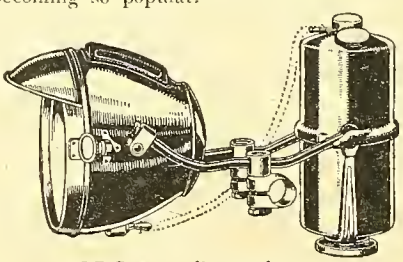
The Gough pocket tool kit.

and the whole may be carried in the waistcoat pocket. This novelty is sold by Mr. A. Gough, 183a, Broad Street, Birmingham, and costs 3s. 6d.

An Acetylene Gas Purifier.

The importance of sturdy construction is a most essential point which is frequently overlooked in the manufacture of small accessories, and causes much inconvenience on the road.

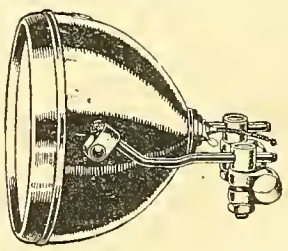
An old principle for purifying the gas in an acetylene lighting outfit is excellently carried out in the purifier illustrated. The construction is unusually strong, whilst a quarter of a turn of the lower milled-edge nut on the base enables the plug to be taken out and the condensed water released. The plug is held by an expanding rubber ring which makes a gas and water-tight joint.



Willcox gas purifier, showing the delivery pipe and base plug.

On a dark night this type of plug, which does not carry any threads, should be much appreciated. This accessory is the product of the Light Car and Motor Cycle Engineering Co., who have recently opened a new garage at 26a, Tulse Hill, Brixton, London, S.W.2. under the direction of Major C. L. Willcox. This firm holds the A.C.U. official repairer's appointment.

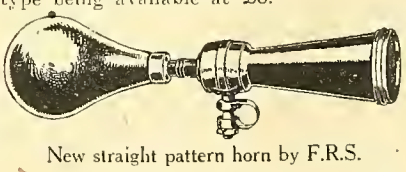
A "Streamline" Gas Lamp.



F.R.S. lamps have, for years, been well known to motor cyclists in this country and overseas, and an entirely new design of gas head lamp by the F.R.S. firm is not without interest, even in these days when electric lighting is becoming so popular.

F.R.S streamline gas lamp.

For the past twelve months two members of *The Motor Cycle* staff have used F.R.S. major gas lamps with every satisfaction, and those who favour the acetylene system will find this lamp all they require for the fastest runs in the dark.

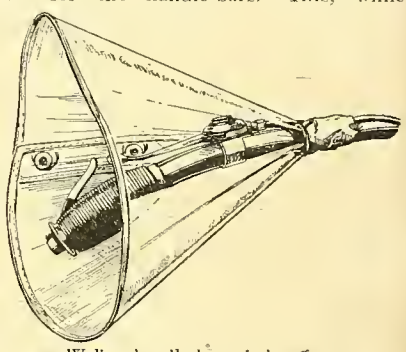


The new Streamline model is a 6in. set having an 800ft. beam and has several features, including a new type of door

The latest F.R.S. electric head lamp.

fastening which prevents the possibility of rattle, an adjustable focus and a genuine optical Mangin mirror. The price is £4, while a 5in. set with a 600ft. beam is offered at £2 15s.

Another addition to the F.R.S. range is a 7½in. electric lamp which, with a 4 volt 8 c.p. bulb is said to give a 1,500ft. beam. It has an anti-glare device operated while riding and is sold for £4, a smaller type being available at £3.

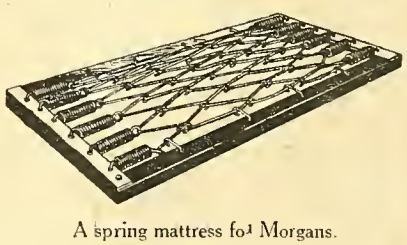


New straight pattern horn by F.R.S.

A neat straight horn is another speciality of this firm, selling at 22s. 6d. The new address of the makers is Beam Works, Vere Street, Birmingham.

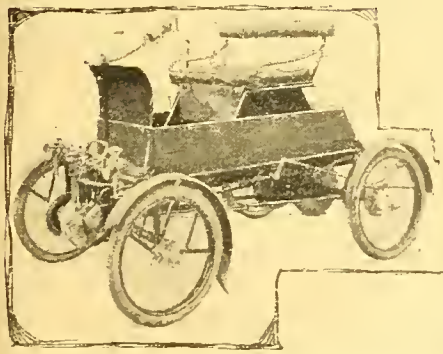
Transparent Wind Cuffs.

The ancient handle-bar muff has long been appreciated by the owners of motor cycles during the winter months. The manufacturer of the Walbro windscreen, Mr. H. S. Wallis, Lynn Road, Ely, has lately placed on the market a variation of this in the shape of a celluloid wind cuff for the handle-bars. This, while



Walbro handle-bar wind cuffs.

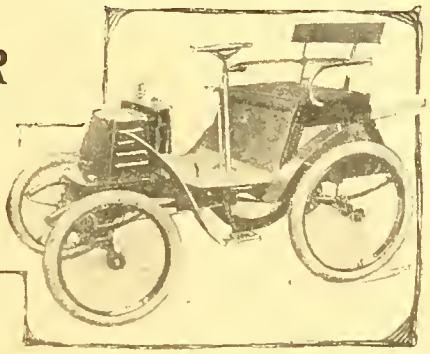
preventing the cold air from circling up the rider's sleeve, allows the position of the control levers to be seen clearly, owing to its transparency. Consequently if the rider has to remove his hands from the handle-bars before replacing them he can see the position of his throttle or spark lever at a glance.



Spring Mattresses for Cycle Cars.

In order to retain a low seating position, many makers of cycle cars fit somewhat thin seat cushions; and owners desiring to obtain greater comfort are not always successful owing to insufficient steering wheel clearance. Here is illus-

A spring mattress for Morgans.



trated a spring mattress, obviously the outcome of road experience, which has been introduced by Mr. L. Marcus, of 9, Golders Green Crescent, London, N.W.11. It is suitable for Morgan Runabouts or similar vehicles where the clearance between seat and steering wheel does not permit the use of a deep cushion, and only raises the cushion about an inch. The price of a mattress for a Morgan is 33s., but any size can be made to order.

A runabout of 1900 having a De Dion air-cooled engine and belt drive. Its weight was 423 lb.

THE SIDECAR ALTERNATIVE

A Brief History of the Cycle Car.

The New Orleans of 1900, which had an air-cooled single-cylinder engine and belt transmission.

At the present time the four-wheeled type of cycle car is in need of encouragement to develop it along sound lines. We urge that the R.A.C. hand over its control to the A.C.U. in order that cycle cars may compete in reliability trials alongside three-wheeled cycle cars of the same weight and engine capacity—i.e., 8 cwt. maximum weight. 1,100 c.c. engine limit.

FOR twenty years or more the cycle car type of vehicle has proved the will-o'-the-wisp of the motor industry. At times it has seemed to promise so much, at others as little of the ideals of the dreamer.

Born in the earliest days of motoring it developed into the small car which, in turn, grew larger and larger into a vehicle weighing over a ton. A few years later, a few makers turned back, as it were, and small cars again appeared, to be eventually dropped, but the little vehicles may be found to-day giving faithful service to those who are content with a moderate speed. We refer to such machines as the old 6 h.p. Rover, 7-9 h.p. Swift, 9 h.p. Riley, Phœnix, 6½ h.p. De Dion, the original Humberettes of 5 and 6 h.p., the 6 h.p. Velox, and the several Baby Peugeots that preceded the miniature four-cylinder model so popular before the war. All of these may be said to be ancestors of the present-day light car.

In the meantime, the motor cycle had developed. From a bicycle fitted with an engine, it became a machine specially designed for self-propulsion, and the next step brought along the trailer and the forecar, and finally it became the luxurious sidecar machine that we see daily. Concurrently there have been attempts to produce four-wheelers, starting with the "Quad." The sidecar caught the public fancy, and the small four-seater on semi-cycle lines, with a very few exceptions, disappeared.

Another Revival.

A decade ago, the cycle car type was again revived, largely due to the undue praise accorded to designs—such as the Bedelia. Promises made at that time that it would revolutionise the passenger motor cycle remain unfulfilled. With four cycle wheels, air-cooled twin engines, and variable pulley devices, these improved vehicles were pronounced as the efficient sidecar substitute. *The Motor Cycle* considered them unmechanical, and in the interests of the innocents did not hesitate to say so. Many other makes quickly appeared, and as quickly disappeared, leaving behind a public distrust of the cycle car, which would never have appeared had responsible design been at the back of the movement. In the meantime, several car manufacturers, recognising the public interest in small two-seated four-wheelers, started to develop light machines grounded on the lines of the conventional car, and knowing that these were likely to provide greater satisfaction, and prove a sounder investment, we encouraged this type. Incidentally, it is not without interest that, as a result of our encouragement of the miniature car, the first details of the Singer, Morris-Oxford, Stellite, and Standard light cars were presented to the world at large in the columns of *The Motor Cycle*.

Thus again the illusive cycle car failed to establish itself as a type. We have always maintained that the cycle car proper would ultimately develop from its chrysalis form, and in our issue for November 3rd, 1910, we expressed our view that "the self-contained vehicle (*i.e.*, a machine of the cycle car type) could be produced at a slightly lower price than the sidecar outfit, and it would possess advantages which the motor bicycle rider at present has to do without."

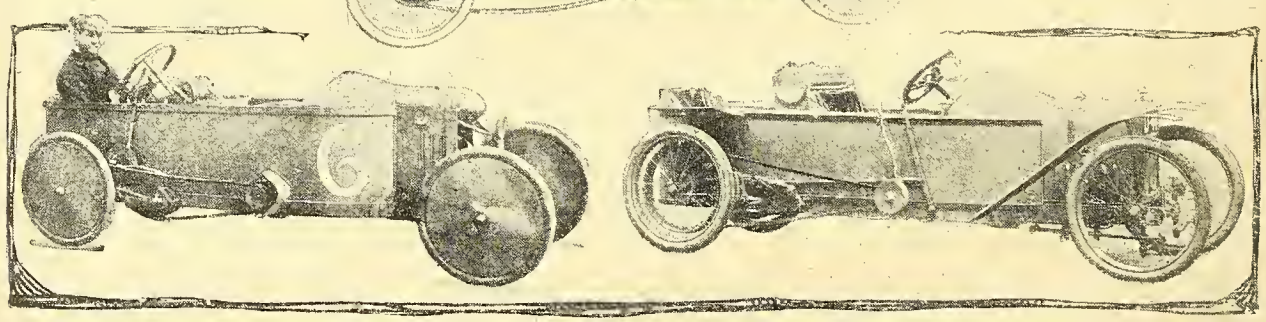
Room for Both.

We still hold that view, but we do not believe that the sidecar is doomed, or that the cycle car will take its place. First produce the cycle car as durable, as reliable, as fast, as economical, and at the same price as the *de luxe* sidecar outfit, and then the sidecar is bound to feel the competition, *provided the taxation is the same*. But the cycle car must not be a cheap looking vehicle at the same price as an ultra-refined sidecar outfit. The majority of owners of the most expensive outfits do not represent the potential market for a cheap substitute for a car. They are now at the top of one class of vehicle, and will not readily change places to be at the bottom of another.

It must not be overlooked, also, that the majority of sidecars on the road are not of the most powerful and expensive type, consequently to form a sidecar alternative, cycle cars must line up in price and performance with all types of sidecar outfits.

Can it be done? *The Motor Cycle* believes it can. Such cycle cars as the Tamplin, G.N., and A.V. have done much in their respective classes to confirm our opinions of ten years ago. Will it be done generally? Not yet! In our judgment, the moderately priced sidecar will retain its present place in the favour of the public for many years to come.

For the present, we regard the cycle car more as a step between the sidecar and the light car, which therefore appeals chiefly to those who want something



The Sidecar Alternative.—

more than a motor cycle but cannot afford a light car. We repeat what we said in 1911, "the motor cycle runabout must possess two qualities: first, it must be cheap; secondly, it must be a go-anywhere machine."

Will History Repeat Itself?

In our issue of January 13th, we published an article entitled "Wanted—A Cycle Car Trial," which was a plea that three and four-wheeled cycle cars be allowed to compete together, either under the A.C.U. auspices or a joint committee of the R.A.C. and A.C.U. It was then pointed out that, although the former body controls all four-wheelers, it has done nothing to promote the welfare of the motor cycle type of light four-wheeler. It is therefore interesting to know that the A.C.U. One Day Trial in April will include four-wheeled cycle cars

We were asking the same question in 1912, when we said: "In the event of the R.A.C. ultimately taking the Quad car under its wing, it ought to do more than say it will look after the new vehicle. It would be better for the A.C.U. to take up these vehicles at once and allow them to participate in the motor cycle trials, than for the R.A.C., after undertaking to protect their interests, subsequently to neglect them."

Three cycle cars of a decade ago with variable gears, utilising very small pulleys, which proved unsatisfactory.

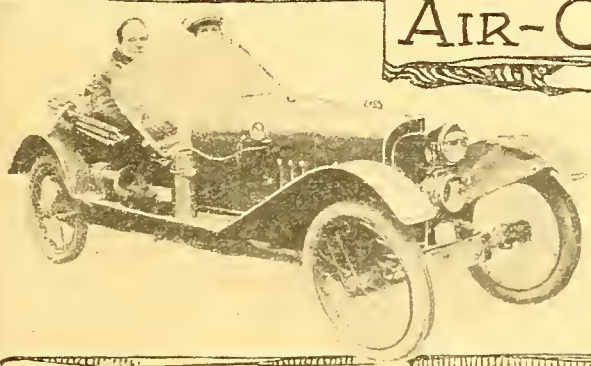
Energetic action ultimately brought the cycle car under the A.C.U. control, and as a line of demarcation, the cycle car was defined as a vehicle weighing not more than 6 cwt. chassis, or 7 cwt. all-on, with an engine not exceeding 1,100 c.c.

It is interesting to recall that in the Colmore Cup trial of 1913, only two cycle cars (a Morgan and a Humberette) out of twenty starters made non-stop runs. True, it was a very severe course—at least, severe in those days, but one which the motor cycles had no great difficulty in negotiating; therefore, the cycle cars failed to prove their equality with the sidecar outfits.

Since this date, manufacturers of car-type cycle cars have increased their weights until they are outside the old definition, and the four-wheeled type with a few exceptions (notably the G.N.) died during the post-war reconstruction period, after the control of four-wheelers had been handed to the R.A.C. with the result that nothing has been done to demonstrate by official trial the new machines which have since appeared. The Cycle Car Club did useful work, but has, of late, under the Junior Car Club, shown more favour towards the already proved light car. As in 1912, the small four-wheeler is nobody's child, a state of affairs which is unfair to maker and public alike.

We have now commenced the third cycle of the motor industry's will-o'-the-wisp. The 1900 machines developed into large cars, the 1910 types into light cars, the 1921 types into—what? Is the cycle to be perpetual? Are cycle cars always to be the nucleus of something bigger? If they have a place in the sun, that place should be recognised and their capabilities proved by public trial. By their specification and price, some of them challenge the sidecar outfit. Let them fight it out on the trial courses alongside motor cycles. There is no room in the motor field for machines of doubtful character. The public want to know more than is told them in makers' catalogues—and the makers desire an opportunity to prove their claims.

From the public standpoint, trials for cycle cars are more necessary than with any other type of vehicle, for two reasons: (1) they are practically untried; and (2), which is even more important, they are so easy to construct (easier, in fact, than a motor cycle and sidecar) that the good work of the few good machines in the hands of the public may lead pseudo-designers to start again to produce unsatisfactory cycle cars such as appeared ten years ago.



Again we urge that the four-wheeled cycle car be allowed to compete with the sidecar and three-wheeled runabout, and that the R.A.C. give back to the A.C.U. the control of a type of vehicle with which the latter is *au fait*.

Defining the Class.

We have previously given our suggestions for a suitable definition, which, we repeat, should include the following factors: (1) a weight limit of 8 cwt.; (2) an engine capacity limit of 1,100 c.c.

One of our reasons for the first is that the Revenue Department is recognising this limit throughout the new taxation system. Three-wheelers are subject to a tax of £4 only, if they do not exceed this weight, which is also the line of demarcation in several other respects. Therefore, four-wheelers under 8 cwt. should be given

The Sidecar Alternative.—

the same privilege as three-wheelers of the same weight, instead of being considered as cars and taxed on the £1 per h.p. basis, with a £6 minimum as at present. If the A.C.U. takes up the small four-wheeler again, it is not improbable that the Government too will class together for taxation purposes all vehicles under 8 cwt.

The present taxation is so unfair to four-wheeled cycle cars that their progress is retarded, since, when fitted with motor cycle type V twin engines of 8 h.p., they are subject to a £10 tax, although their capacity is only 998 c.c. or less. A fully fledged car, with four-cylinder engine of considerably greater capacity, and weighing anything up to a ton or even more, is only subject to the same tax, while on a three-wheeler of 8 cwt., only £4 is due as against £6 for a little buck-board of a third the weight, and with an engine one-third the size.

In some quarters it is thought that 1,000 c.c. would be a suitable limit for a cycle car engine, but this would be distinctly unfair considering that most of the three-wheelers with which they would compete have engines between 1,000 and 1,100 c.c. (T.B., Coventry Premier, New Hudson). It may be well to emphasise here that the public generally does not trouble whether a machine conforms to a definition or not—but a definition is necessary for classification purposes.

There is no doubt that the present-day cycle cars are vastly superior machines to those of a decade ago, and given a fair trial, there is every chance for them to make good. Ten years ago, when we had occasion, in the interests of our readers, to criticise the design of cycle cars rather harshly, we prophesied that the cycle car would take ten years to develop. It has. What is wanted now is proof that the development has been along the right lines.

The Future of the Two-stroke.

Some Comments bearing on the Present-day Position of this Popular Type of Machine.

ON the subject of the past and present popularity and potential possibilities of the lightweight, a prominent motor cycle manufacturer a few days ago expressed the opinion that the two-stroke machine had reached its zenith. This particular maker, it should be noted, makes both two-stroke and four-stroke machines, so presumably he is unprejudiced.

That the two-stroke machine is simple was agreed; that it cost very nearly as much to manufacture, the cycle parts being identical, was also agreed; but that the speed of the two-stroke was too low and could not be maintained at a high average was a statement with which I could not agree.

I have ridden many makes of two-stroke machines, and several makes of lightweight with four-stroke engines, and I have come to the conclusion that, capacity for capacity, the best two-stroke machines are as fast as the best four-stroke types, and, more important still, they will maintain their tune longer. I do not agree that the two-stroke, if properly designed, well made, and built of the right material, will not stand up against a four-stroke machine of equal capacity under ordinary touring conditions. At the same time, I believe that under racing conditions a four-stroke machine could be tuned up to travel faster than a two-stroke, but racing is not the motor cycle's sole reason for its existence.

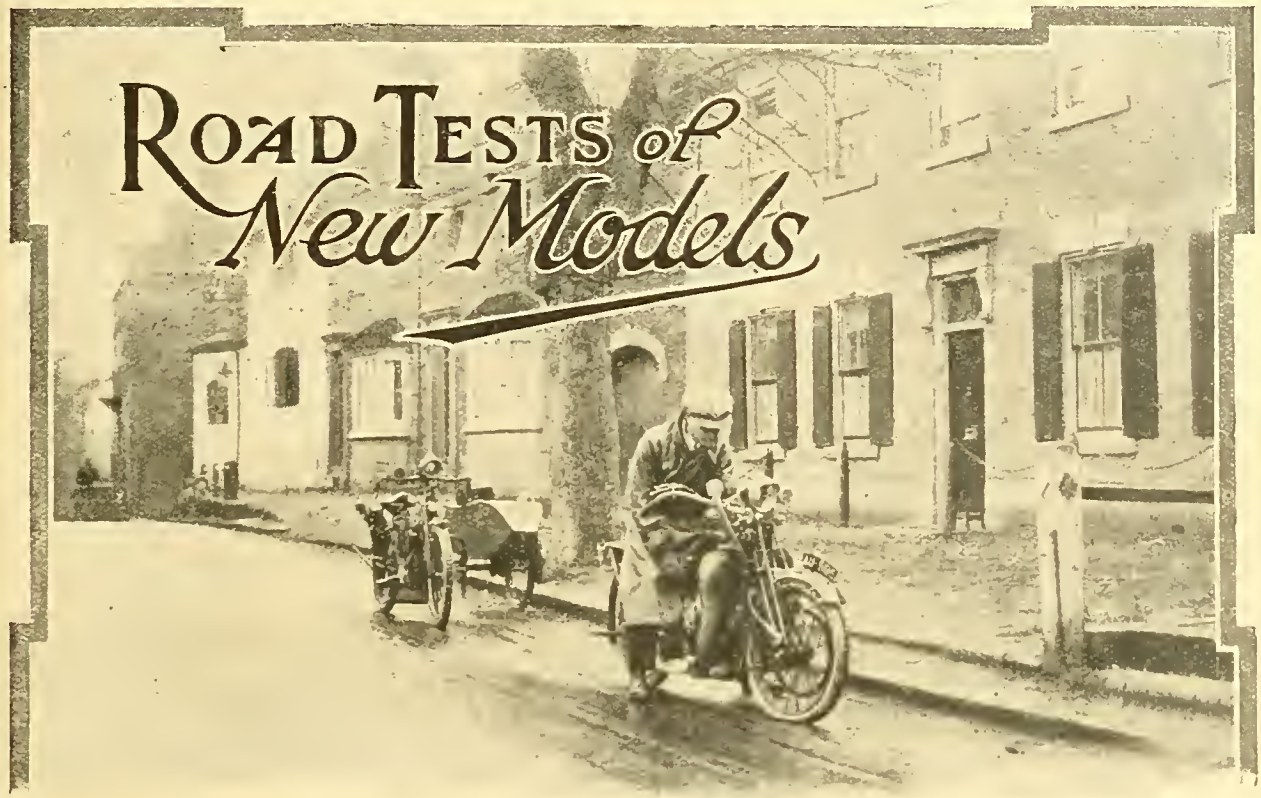
Its Faults and its Charms.

The two-stroke is at its greatest disadvantage when petrol consumption is under discussion, and it is well known that in this respect the type does not shine, and I am afraid the difficulty is almost insurmountable so long as present two-stroke practice is followed, and no additional complications are added to the usual method of charging and exhausting the necessary gases. By more careful study of the question, and closer attention to finding the most suitable type of carburetter, and then giving the most suitable setting to attain the best all-round results, a great saving of petrol could be attained in many instances.

The two-stroke has as its greatest charm its simplicity and flexibility, which really means its ability to develop maximum power at varying speeds or under varying loads, in many instances to such an extent that a two-speed gear can be dispensed with for all practical purposes.

As to the difficulty of getting regular running, the elimination of irregular "two-stroking" can be overcome by a correct design of piston head and cylinder ports, in conjunction with a suitable carburetter.

To Displace the Pedal Cycle



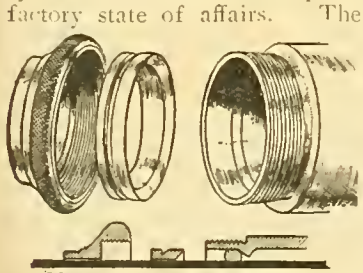
It was prophesied in these columns several years ago that the two-stroke was the machine of the future, the machine for the million—the writer went so far as to say millions, and he still believes this to be the case, in spite of the fact that the present cost of production of a lightweight four-stroke is almost identical. This confidence is based on the simplicity of the two-stroke, its ability to maintain its "tune," its flexibility, and consequent possibility of working without a somewhat costly, complicated, and heavy two-speed gear box, and, above all, its simple construction and fewness of working parts, which make it so pre-eminently suitable for the inexperienced or those who do not possess an engineering turn of mind.

The two-stroke engine carries with it the future of the real lightweight motor cycle, the type so frequently advocated in these columns—the 80 lb. or 90 lb. machine which will ultimately take the place of the pedal cycle, and sell by the thousand. Such a machine will not be suitable for the average reliability trial, or Six Days courses such as those of 1919 and 1920, but it will be good enough to take its owner anywhere within reason, and take him there in comfort and with that peace of mind which can only be attained by reliability coupled with the knowledge that if anything does go wrong it will be simple to put right.

The coming of the lightweight sidecar outfit will help to popularise the tiny two-stroke, and those who have not yet had the experience of driving one of these wonderful little outfits should hasten to do so. The two-stroke is doomed, it has been said. It *is* doomed—doomed to success and to become the machine of the future.

R.V.C.B.

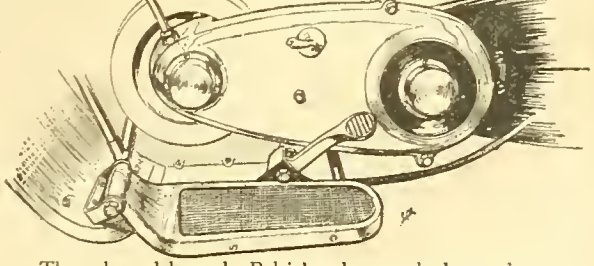
ROAD TESTS of New Models



THE 5 h.p. RALEIGH.

SPECIFICATION.

ENGINE: 77 × 75 mm. (700 c.c.) flat twin four-stroke.
LUBRICATION: Drip feed.
MAGNETO: Lucas.
CARBURETTER: Amac (two-lever).
GEAR BOX: Three-speed, constant mesh type, modified Sturmey-Archer.
TRANSMISSION: Enclosed chain.
WHEELS: 650 × 65 mm.
FORKS: Brampton Bi-flex.
FRAME: Leaf spring.
WEIGHT: 290 lb.
PRICE: £162 15s. solo; £204 15s. sidecar.

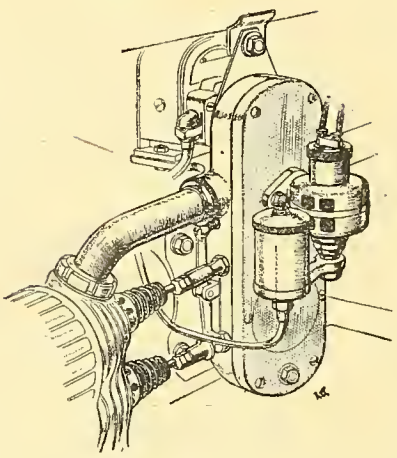


THERE are few firms capable of retaining interest in a product when more than two years elapse between the lifting of the veil from the first model and the actual commencement of deliveries. The Raleigh Cycle Co. is one of the few. A clever design in the first case, and an excellent reputation in the pedal cycle world—fully 90% of the motor cycling community were originally pedal cyclists—these two factors probably explain this satisfactory state of affairs. The fact that two intervening "Shows" revealed an increasingly attractive Raleigh kept alive the interest of even the most casually-minded rider.

How the induction pipes are attached to the passage in the timing cover. The bevelled ring compresses a ring of asbestos string to obtain a simple gas-tight joint

It was, therefore, with a feeling akin to eagerness that we took over one of the first batch of production machines to satisfy ourselves as to whether it was, or was not, as good as it looked. Our expectations were high, and high expectations breed a keenly critical frame of mind.

It had been whispered, too, that the new Raleigh was fast. Now we may confess that in terms of Brooklands and sheer speed. Rumour proved once more a lying jade. But, contradictory as it may seem, there are few T.T. and fewer touring machines on the road



The only pedal on the Raleigh—the rear brake—and a very convenient one, too. Note the clean business-like lines of the footboards, chain cases, and mudshield

Road Tests of New Models.—

to-day that could average safely a better time on a long journey *in the hands of an average rider*. Fifty-five miles per hour as a maximum is claimed by the makers: in our case we failed to persuade the needle of a reliable speedometer further round the dial than fifty-two. But (1) it would stay there, (2) the machine was as "steerable" at that speed as at ten, and (3) it might be sent back to "ten" more quickly than the works of the speedometer allowed for, but with an even smoothness that surprised us. More, however, of the rear brake anon.

Upturned handle-bars, footboards, and a spring frame have never, singly or collectively, entered into the writer's ideal specification of a solo mount, and, coupled with a hefty 700 c.c. engine, we confess that we anticipated—well, a feeling of awkwardness, if nothing worse, during the preliminary negotiation of the busy streets of Nottingham.

An induction system that is unusually neat. The space around the passage through the timing case is warmed by oily vapour, which serves also to lubricate the magneto chain.

Speed—with an Easy Mind.

Directly after the first corner, however, we realised the fact that controllability, balance (of the machine as a whole), and steering were exceptionally good: and before we had glided past the last tramcar we felt as if we had owned the Raleigh for years (incidentally, fancy was playing all sorts of pretty mathematical tricks with a certain bank balance, in an effort to make it pan out at £162 15s.!).

Opening out, the Cowey very quickly said "forty," then "forty-five"; and, accustomed previously to grip a shade tighter and to "get down to it more" on such occasions, it seemed almost ludicrous to be sitting up and admiring the scenery as comfortably and calmly as on a family sidecar. Only the rush of air (and of milestones) saved the Cowey from a charge of gross exaggeration.

Suddenly a wandering pup, evidently agreeing that it was too easy, rushed out on to the road about fifty yards ahead—behaving as if he were a goal-keeper and we were the opposing forward with the ball. These "do or die" tactics of the average dog are often a huge bluff: but we were taking no chances. Home went the throttle and down the brake pedal: we ambled past that cur at less than "five"—too surprised at the sudden and smooth pull-up to carry the football analogy to its logical conclusion!

Three factors help toward such excellent braking—good design of the amply proportioned internal expanding brake itself, an unusually long pedal, and a very convenient position for that pedal. It is very true that a machine is, or should be, only as fast as its brakes allow. Here, then, is one reason why the Raleigh is a suitable mount for the man in a hurry or for one who craves but comfort and reliability.

Regarding comfort little need be said. That much-desired quality is there in large quantities, or perhaps it would be an improvement from the literary point of view to say that discomfort is entirely absent at all speeds. We tested it on some very rough going indeed, and it came through with flying colours.

Pointers in Design.

Such a machine must be ridden at least 5,000 miles before one can speak authoritatively on how the frame maintains its lateral rigidity; but, judging from appearances, this should not be a weak spot. Incidentally, the neatness of the frame was a subject for admiring comment wherever we went. The wheelbase is kept down by making the specially designed Sturmey gear box a member of the frame assembly; and the springing pivot is thus very near indeed to the transmission centre, and is also slightly higher than that point. Therefore, the variation in the two arms is practically negligible. A 75% portion of the rear mudguard is independently attached with the carrier to the wheel, ensuring constant tyre clearance.

Returning to our road impressions, one naturally expects a 700 c.c. engine to play with most single-figure

The average big twin when used as a solo machine conveys an impression of weight, especially at low speeds, but not so the Raleigh, which is as easy to handle as the majority of "singles."

Road Tests of New Models.—

gradients. Expectations in this case were more than fulfilled. As an example, we may cite Edge Hill, which was taken on the run after twenty miles' hard going. Only caution on the initial corner, which was very greasy, necessitated forsaking the top ratio. Should traffic or road conditions make a slow climb preferable, one could not ask for a more suitable mount.

The shock absorber (on a boss outside the flywheel, and a Raleigh patent), and the clutch, both function very smoothly and well, and acceleration is all that could be desired throughout the range of throttle positions. Indeed, "responsive" is an attribute that may very aptly be applied to this machine. Lubrication, by an Enots sight feed, once set attends to itself; and fuel consumption for hard solo riding works out at over 75 m.p.g.

So far we have dealt out nothing but praise: in fairness to all, there are two points that call for criticism. It is true that they do not call loudly, and it is true that they are but details. (1) The valve gear (and indeed the engine as a whole) is not so silent as one would expect on such an otherwise excellent machine: possibly the curved metal legshields intensify the clatter. (2) Clearance in the primary chain case does not appear to be quite adequate. An adjustment of the chain was found necessary early in our test, and, before it was made, the chain made its condition heard. This was our only adjustment, the Raleigh method of sliding the whole engine forward proving remarkably easy.

Summing up, the new Raleigh as a solo mount possesses a combination of virtues, but rarely found in one machine; and it is probably unique as a spring frame big twin so fascinating *sans* sidecar. Delivery has now commenced, and an extensive new factory will shortly increase three-fold the present rates of production. We predict that the man who likes luxury will not allow this enterprise to run to waste.

A low saddle position of the Raleigh permits the rider of average height to place both feet firmly on the ground.

THE PRICE OF MOTOR FUEL.

THE second report on motor fuel by a Sub-committee appointed by the Standing Committee on the investigation of prices has now been issued in the form of a White Paper, and contains many interesting points. The report deals with two headings: (1.) The high price of various petroleum products. (2.) Alternative fuels and other sources of power.

With regard to prices it is recommended that the Government should control freight and fix distribution charges in this country, and that the powerful combinations controlling petroleum products should be controlled by the combined action of consuming nations through the economic section of the League of Nations.

Under the second heading it is recommended (1) that all gas companies above a certain size should be compelled completely to extract benzole from the gases, (2) that shale oilfields should receive Government encouragement for speedy and extensive development, and (3) that power alcohol should be produced in such tropical and sub-tropical parts of the Empire as are suited to its production.

It is recommended that electricity, gas, and steam should be used for transport as far as is possible. It is pointed out that in the case of the two latter sources of power good working plants are already in use for commercial traction.

It is emphasised also that the production of substitutes, and the adoption of alternative sources of power can only reduce prices to a reasonable level if their production and distribution are kept free from the control of monopolists.

CAR PRACTICE OR SIMPLICITY?

Are Car Features Desirable? The Question of Idealism *v.* Practicability. Externals and Internals.

CAN motor cycle designers copy with advantage the best features of car practice? A critic in these pages, subsequent to a visit to the Olympia Motor Cycle Show, averred that much could be learned by motor cycle manufacturers from modern car design.

Largely on the score of low cost of production and the banishment of unnecessary impedimenta on a machine intended as a poor man's motor vehicle, we qualified his plea. Clearly many things may be desirable in a design when cost is no consideration, but when "price" is a question of paramount importance, success can only be achieved by simplicity in design—or, at any rate, by a compromise.

Certainly the car has many qualities which the motor cycle has not, and these the motor cycle designer should set himself to provide. As to whether these attributes will be obtained by following car practice is an open question. We refer to such questions as silence—both mechanical and exhaust—protection from the elements and mud, and increased comfort.

When Critics Disagree.

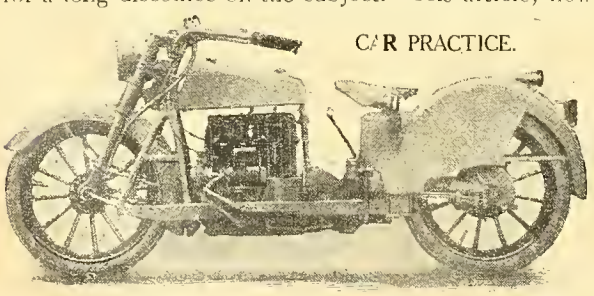
Other critics have entered the field, and, generally speaking, it would appear that critics accustomed to cars are naturally prejudiced in favour of that type of vehicle. They consider that motor cycles should embody car features, since, in their opinion, the car is the superior vehicle of the two. On the other hand, motor cyclists are inclined to resent any suggestion that motor cycles should follow car practice, merely on the plea that it is car practice.

The original article which opened the discussion—the criticisms of a car engineer—was confined to mechanical elements, and the comments which have followed have hinged upon the advantages of introducing in motor cycles features more general in car design. The aspect of the matter was discussed in our leading article of January 20th, when we expressed the view that "if motor cycles were designed to embody all the points favoured by the car expert, there would be no longer the wide difference between their prices . . . . It may be an ideal to produce a car on two wheels, but ideals are not always profitable, either to maker or user."

The Times correspondent on motoring matters now enters the controversy, using our comments as his text for a long discourse on the subject. His article, however, includes many points which have no part in the original criticism, and, although put forward to show how much the motor cycle designer can learn from car design, they have no bearing on the subject, "Car practice in motor cycle design."

"The problems of power development and power transmission are almost identical for both types of machine," he writes, "and if the designer of the one kind is not prepared to learn something from the designer of the other, he is merely denying himself advantages without any just cause. It is fair to presume, however, that the motor cycle is in a position to extract the greater benefit from any interchange of ideas, seeing that, as a vehicle for the transport of passengers, it is so obviously less highly developed than a car.

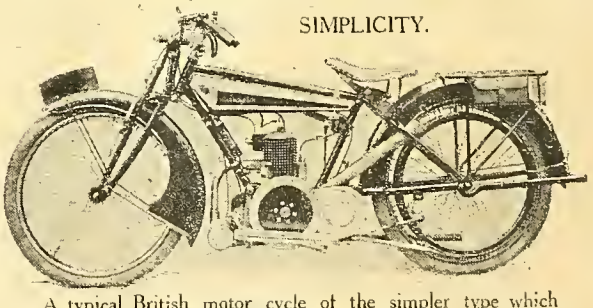
"The mere fact that the motor cycle demands special clothing," *The Times* continues, "is a case in point." We do not agree that it is a case in point. To render a motor cyclist immune from the inconveniences of mud does not necessarily mean following car practice. In the majority of cases the special clothing mentioned is necessary to protect the rider from the wind and cold more than the mud.



That motor cycles are capable of being made more weatherproof is admitted—and *The Motor Cycle* has been insistent in demanding attention to this vital point, but, as pointed out previously, this is hardly relevant to the question as to whether motor cycles should follow car practice.

An Unfair Inference.

Another statement by *The Times* correspondent is that "One cannot shut one's eyes to the fact that the two-wheeler is more often found in trouble by the side of the road than is the ordinary car, even if the latter is sold at a figure which comes within £20 or £30 of the price of a high-class sidecar combination."



This infers that the modern high-priced motor cycle is less reliable than the car, which inference is entirely erroneous. Actual breakdowns are really few and far between, and roadside adjustments come under several headings. First, the motor cyclist is prone to "tinker"—it is part of the game! A keen rider is part and parcel of his mount, so to speak, and enjoys nothing more than extracting the last ounce of

CAR PRACTICE.

The American Militor, which may be regarded as an example of over-development through following too slavishly the features of the car.

SIMPLICITY.

A typical British motor cycle of the simpler type which car practice has not influenced in any way. Had motor cycle designers followed car practice, two-stroke engines would not have been developed.

Car Practice or Simplicity ?—

efficiency. The motor cyclist who is content to leave well alone seldom has an involuntary stop.

Out of Date Cars Scrapped.

Secondly, there is a class of rider who, having a distinctly limited capital, purchases a worn-out machine, and naturally does not obtain greater reliability than is to be expected. This class of driver in the car field is practically non-existent, for the reason that very old second-hand cars are too expensive to run by the class who otherwise might use them. Most of the car contemporaries of many motor cycles on the road to-day are only to be found in odd corners.

Thirdly, the number of motor cycles on the roads considerably exceeds that of cars, and, lastly, quite a large section of motor cycle users are youths who add to the ranks of the first-mentioned group by their natural thirst for knowledge.

Refinement and Cost.

Every motor cyclist desires the greatest possible refinement and comfort *provided the price of a motor cycle does not become prohibitive. The Times* correspondent goes so far as to agree with us on this point, but, after saying that the problems of power and transmission are identical in each case, he goes on to state that "it is not for a moment suggested that motor cycles should all be made with water-cooled four-cylinder engines, cone clutches, four-speed gear boxes and propeller-shaft transmission, nor even be fitted with detachable wheels and dynamo lighting sets," and says, *"each vehicle must be considered from a design point of view on its merits. It is therefore only natural that, in regard to engines and transmission, there should be wide differences in principle between car and motor cycle.* These are practically the same sentiments expressed by ourselves.

At no point does he suggest where a motor cycle can be improved by adopting car practice, but cites the appeal which the average motor cycle makes to the woman user. "It is," he states, "incomparably less than that which is made by the average car, and the reason for the difference is *solely* connected with internals" *(sic.!)*. He proceeds to infer that a lady's partiality for a car is due to the fact that its mechanism is hidden.

No doubt there is a deal in this—the average woman thinks a car is much less complicated than a motor cycle, whereas the reverse is the case—but the reason cars have a greater appeal to the average lady may be the same that induces her to pay several guineas for a hat when a few shillings will buy something which will give perhaps better protection for the head.

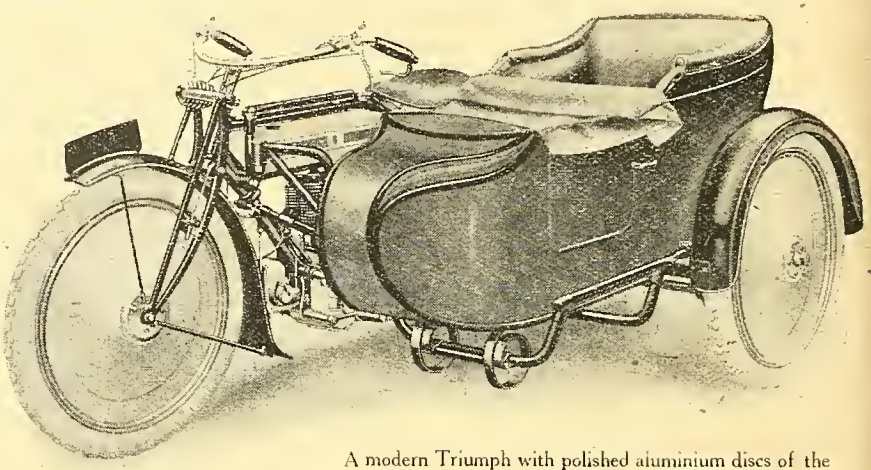
Limitations.

We repeat that because certain features are embodied in a car is no criterion that they will improve the motor cycle. By all means let the motor cycle designer and the car designer take advantage of each other's experience and knowledge. They do so already at the meetings of the Institution of Automobile Engineers, but successful motor cycles designed by car engineers have been distinctly rare. That so much has to be embodied in so little space in a motor cycle is one of the most important points often overlooked by the car designer.

On the other hand, there are points on the motor cycle which car designers could emulate with advantage. Despite the room available in a car chassis, the engine and gear box, especially, are extremely inaccessible.

Prices of Second-hand Motor Cycles.

A Schedule of Prices at which used and shop-soiled Motor Cycles were being offered in the miscellaneous advertisements of last week's issue of "The Motor Cycle."



Make, H.P., and Date.	Classified Prices.	Average Price.

THE WHEEL DISC VOGUE.

Special Advantages when Fitted on Sidecar Outfits.

LIKE twist grips and pillion passengers, disc wheels probably take a little getting used to on a solo machine. As to such factors as side wind pressures, I prefer to leave them to experienced solo riders to decide among themselves. I am more interested in the sidecar outfit, and driving one continuously robs one of a true perspective where solo machines are concerned. I am as ardent a sidecarist as "Ixion" is a solo rider, and therefore consider disc wheels from the standpoint of the passenger machine man.

A modern Triumph with polished aluminium discs of the Ace variety.

It is the all-weather motor cyclist who fully appreciates the advantages of wheel discs, which to many fair-weather riders are added merely for refinement. There is no doubt that a set of well-made discs enhances the appearance of a machine, but it is the utilitarian view one takes at this time of the year, when they save much time in cleaning the machine.

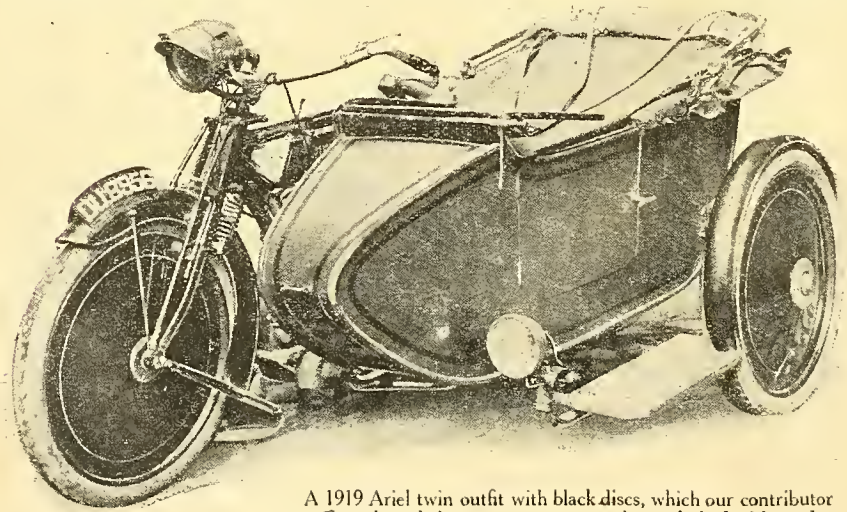
To remove the mud from exposed wheels is a long task, especially if the mud has been allowed to dry, but with discs fitted it is but a few minutes' work with the hose and wash leather.

After experience with several types of discs I can vouch for their utility, and also enumerate the disadvantages of certain types, both as regards appearance and utility. Some of these are: (1) They sometimes creep, and when it is necessary to inflate the tyre, the disc is found to have moved round until the valve is nowhere near the valve cover in the disc.

SEMI-DISCS FOR SOLO MOUNTS.

A feature of the New Hudson Sports Model

(2) The method of fixing by means of a number of small nuts and bolts near the periphery has certain disadvantages. The bolts impede the cleaning operations, and to remove the mud around them is a lengthy operation.



(3) Black and coloured discs look very well when they are new, but after traversing a few miles of wet road they give the machine a muddy appearance by the splashes that are upon them. They are also easily scratched, and a coloured disc that has lost its first gloss soon detracts from, rather than enhances, the appearance of the machine. For this reason a neutral colour is better than black—or, better still, aluminium.

(4) There are some discs that never really present a smooth finish, and under way on the road they convey an idea that the wheels are out of truth. This illusion also occurs on a mud-stained disc which is enamelled black.

(5) Painting a disc in several colours, like the sign displayed by aeroplanes, also gives the idea that the wheel is wobbling.

(6) Occasionally a sheet metal disc will drum; and with any type, if one drops a few valve parts into the interior, on starting off or slowing down, they make a new kind of (more or less!) musical instrument.

(7) Those discs with flaps to cover the valve holes have been known to require a certain amount of periodical attention, or the flaps become loose, and, swinging on the pivot of its retaining bolt, not only make a fearful din—which

A 1919 Ariel twin outfit with black discs, which our contributor affirms lose their smart appearance when splashed with mud.

The Wheel Disc Vogue.—

may be speedily rectified—but so mark the disc that until it is re-enamelled its beauty is destroyed.

In summing up, one may say that all disc wheels save a considerable amount of time in cleaning, but some save more time than others: that most enhance appearance, but some are better than others.

Personally, I prefer the type that is made in one piece of aluminium, and has flange fixings, such as the Ace, made by the Cornercroft Co., of Coventry. The latest type of this company's disc also embodies a device to prevent creeping. There are other discs I should like to try: for example, I once came across a black celluloid disc with flange fixing, which I rather suspect infringed the Ace patents, but the material seemed to offer certain advantages; then there is the disc made of W.A.G. transparent fabric by the Mason Leather Co., of 20, Charminster Road, Bournemouth. If I have a solo machine this year I may try the New Hudson idea of half-discs, such as were fitted to the sporting model of this make at the Show. In any case, on my sidecar machine I shall have discs of some kind, for poking about a wheel with a spoke brush will no longer be tolerated by VEDETTE.

Order of Merit in Six Days Trials.

Power-weight Ratio and General Performance.

THE suggested regulations for the forthcoming A.C.U. Six Days Trials are of interest to most motor cyclists, and there is one point on which we voice the opinion of most of our readers when we say that one important improvement over last year's arrangements would be to issue the official report while the results are still remembered. Last year the trial was held in August, but the judges' report was not issued until the Olympia Show had opened.

Notwithstanding the delay, however, many motor cyclists obtained the report and studied it carefully, and as the 1921 trial is a topic of the present time, we give below the result of an analysis on the part of the Rev. J. M. Philpott, of Nuneaton, who has re-arranged the order of merit by a simple formula. Our correspondent writes as follows:

A question often asked at the end of a trial is—what was the best performance? The answer generally is no more than an expression of opinion. With the help of the judges' report, however, it has been possible to arrange the whole list of the finishers in the Six Days Trial in order of merit, taking into consideration the following details: Weight, power, hill-climbing, speed. The method is as follows: Find the weight-power ratio, *i.e.*, divide the capacity of the engine—in c.c.—into the weight—in lb.—of rider and machine, multiply this figure by the speed—in m.p.h.—on Brooklands; to the result add the marks gained in hill-climbing. There appear to have been twenty-five hills—including Park Rash—on which failures were noted. For each clean ascent two marks have been awarded. In the case of three-wheelers 20% has been added to the weight-power ratio to balance the extra road and wind resistance. This sounds complicated, but put as a formula it is seen to be simple.

Figure of merit = $R \times S + H$ in case of two-wheelers.

or $= \frac{6R}{5} \times S + H$ in case of three-wheelers.

Where $R = \frac{\text{Weight in lb.}}{\text{Cubic capacity in c.c.}}$

S = Speed on Brooklands in m.p.h.

$H = 50 - (\text{number of hill failures} \times 2)$.

This method perhaps seems to place undue emphasis on the speed maintained on Brooklands, but reflection shows that after all it is the acid test of fitness at the end of a gruelling week. That the method gives a fair idea of the comparative merit of all types is shown by the fact that in the first twenty, nine are solos, nine sidecars, and two Morgans. The following is a list of the first twenty:

1.	E. F. Goodman (2¾ Velocette)	119.89
2.	F. J. Price (2¾ Diamond)	100.15
3.	G. Kuhn (2¾ Levis)	103.01
4.	S. Wright (4½ Humber sc.)	101.53
5.	G. Denley (2¾ Velocette)	101.36
6.	H. F. S. Morgan (8 Morgan)	100.83
7.	S. Jones (2¾ Velocette)	100.72
8.	K. Robinson (3 A.B.C.)	100.05
9.	E. James (10 Morgan)	96.41
10.	P. Pehrson (4½ Dunelt sc.)	96.08
11.	H. R. Davies (6 A.J.S. sc.)	95.11
12.	T. J. Ross (7 Matchless sc.)	91.95
13.	J. Cooper (6 A.J.S. sc.)	91.81
14.	G. E. Stobart (7 James sc.)	94.70
15.	E. Williams (9 A.J.S. sc.)	92.76
16.	O. Wade (6 A.J.S. sc.)	92.65
17.	J. W. Wills (2¾ Verus)	92.59
18.	R. B. Clark (2¾ Coulson)	92.15
19.	D. Alexander (8 Enfield sc.)	92.03
20.	T. C. de la Hay (3½ Sunbeam)	91.81

The public displayed great interest in the 1920 Six Days Trials. Any system differentiating the performances by formula should give the general public a true conception of the merit of the respective machines.

West Kent M.C.

The club held a speed-judging competition over a very sporting course on the 30th January, the winner being E. E. Williams (6 A.J.S.), who had a total error of 32 seconds.

Cheltenham and District M.C. and L.C.C.

A whist drive and dance held recently at the Town Hall, Cheltenham, attracted a company of about 360. During the evening the prizes won during 1920 were presented by the Mayor to the successful competitors. Incidentally, the prize list was of most imposing dimensions.

East Midland Centre A.C.U.

The annual meeting of the East Midland Centre of the Auto Cycle Union will be held on Saturday afternoon, February 19th, at 3.30, in the room over Bennett's garage, Shakespeare Street, Nottingham. Representatives of all clubs in the area, whether as yet members of the Centre organisation or not, are heartily invited to be present.

Ealing and District M.C.C.

On January 24th the annual general meeting of the Ealing and District Motor Cycling Club took place at the Prince's Hall, Town Hall, Ealing, Dr. A. M. Low in the chair.

Dr. Low commented on the splendid work done for the club throughout the year by the honorary secretary, Mr. F. A. Longman, and said that, as a recognition, he suggested that Mr. Longman should be made a vice-president of the club. The name of Mr. J. A. Masters was put forward for election as captain, and was received with loud acclamation. Dr. Low was again unanimously elected president, and Messrs. F. A. Longman and A. Tilbury honorary secretary and honorary treasurer respectively.

Bristol M.C.C.

Although their opening run is not until the 19th inst., the Bristol Club started their programme on Saturday, January 29th, when they paid a visit to the Bath Club. Despite inclement weather, about thirty-five members ran over from Bristol, being met, outside Bath, by a few of the local members, who led the way to headquarters and tea. Some sixty members of the two clubs were present, and all adjourned to the Palace Theatre later. An excellent idea, these friendly meetings of neighbouring clubs, and the two western cities, to judge by their fixture lists, intend to meet on a number of occasions this season, both in competition and socially. A return visit of the Bath Club to Bristol, with similar entertainment, is planned for February 12th.

The Motor Cycling Club.

The opening run will take place on Saturday, March 12th, to Brighton as usual. A dinner will be held at the Old Ship Hotel at 7 p.m., at which the medals won in the London-Exeter run will be handed to those of the competitors who will be present. As the accommodation is limited, each member will be entitled to two tickets each. The price of a ticket is 10s. 6d. Early application should be made to Mr. W. H. Wells, 366, Euston Road, London, N.W.

TO CLUB SECRETARIES.

For reference purposes and in order to place on record the numerical strength of organised participants in the pastime, will club secretaries please supply us with the following information:

(1) Date on which club was formed.

(2) Number of members on January 1st, 1921, or in the case of a newly formed club, at current date.

(3) Fixture lists for 1921—when ready.

(4) Secretary's address.

(5) Press Secretary's address.

(6) Whether affiliated to A.C.U. or not.

Envelopes containing club matter should be marked "Club" on the top left-hand corner, and addressed to the Editor of "The Motor Cycle."

Gloucester M.C.C.

It was decided at the annual general meeting on January 31st that the club should affiliate with the A.C.U., and also join the Western Centre (A.C.U.). Canon C. E. B. Kingsford was elected president for the ensuing year. It is hoped that all local motor-cyclists will support the club. The subscription is 10s. 6d. Further particulars may be obtained from the hon. secretary, Mr. G. Brooking, 24, Alexandra Road, Gloucester.

Norwich and District M.C.

The first annual general meeting of the Norwich and District M.C. was held recently at the Bell Hotel, Mr. C. J. Paul in the chair. The secretary (Mr. P. V. Howes) read a letter from Mr. Anthony Sargeaunt, of Mulbarton Hall, intimating that he would be happy to accept the presidency of the club for 1921, and would do what he could to further its interests.

The Chairman presented the awards to the prize winners at the Ringland hill-climb and the reliability trials. The Secretary's Cup (presented by Mr. P. V. Howes) was won by Mr. W. G. Barnes.

N.E.A.A. (Motor Cycle Board).

The Motor Cycle Board of the N.E.A.A. has decided to hold a gymkhana near Newcastle on 28th May, and a team trial on 14th Augnst. It was reported that the Durham M.C. had applied to have the third A.C.U. open event placed at the disposal of the Board allotted to them, and it was decided to agree. Mr. A. Cordner was re-elected as secretary.

North London M.C.C.

The first run of the year, on Saturday, 26th February, will start at the Orange Tree Hotel, Friern Barnet Lane, at 2.45 p.m., and tea will be served at the Red Lion Hotel, Radlett. This event is the opening and invitation run, and visitors are specially invited to come along with the club.

The club has provisionally selected 10th September for the open trial, for which a permit has been granted.

Ipswich and District M.C.C.

Although only recently re-formed, the above club shows every indication of being a great success. The number of old and new members enrolled at present exceeds ninety, and it is hoped to increase this number considerably before Easter. An attractive programme is being arranged, embracing sporting, social, and inter-club events, and the honorary secretary, Mr. Hugh O. Goldsmith, 355, Norwich Road, Ipswich, will be pleased to supply any information to motor cyclists desirous of joining.

Stafford and District M.C.C.

The annual meeting of the Stafford and District Motor Cycle Club was held on Tuesday, February 1st, when the club was reported to be in a sound financial condition after the first season's working. Mr. F. G. Amies was re-elected chairman, Mr. F. M. Webb secretary, and Mr. G. Sandy treasurer, while Mr. E. M. Waitt was elected captain and Mr. Keith Amies vice-captain. It was decided not to affiliate with the A.C.U.

The opening run was arranged to Chester on March 20th.

Worcester and District M.C.C. and Worcester M.C.

At the Pack Horse Hotel, Worcester, on January 31st, Mr. W. T. Thorne delivered another of his interesting series of lectures to a number of members and motorists. He commenced his lecture with the condenser of the magneto, again carefully going over where he left off in his previous lecture, sparing no pains in thoroughly explaining everything before passing on to the tuning of a motor cycle engine, followed up with the tuning of multi-cylinder engines, including car engines.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

DANGERS OF DRIVING TESTS.

Sir,—Examination for driving licences is in the air.

If a man is examined in a provincial town he may not be fit to drive in London; if he is examined in London it will not teach him not to pass on country corners.

All this means new officials; with more taxes to pay their salaries or licences costing pounds instead of shillings.

Let us make our associations fight it. E.P.H.

London, W.1.

SYNDICATED PROPAGANDA.

Sir,—My congratulations on your timely article (of Jan. 27th), "Syndicated Propaganda." From my personal experience of the motor cycle in India and Kashmir, I should say that British motor cycle manufacturers must sooner or later endorse the Syndicate System if they wish to hold their own.

To carry the matter further, how would a syndicate of the twenty-five leading makers with five depots at Karachi, Calcutta, Bombay, Madras, and Colombo, appeal to British motor cycle manufacturers? I am certain they would soon have the Indian market in their hands again.

AUDENTES FORTUNA JUVAT.

Bromley.

FOLLOWING THE SPORT ON PAPER.

Sir,—*Re* the gentleman who had twelve machines in four years, I think it a direct incentive to some of us poor wretches who follow the sport on paper to commit a burglary, when they realise that one man can toy with that number and they with none. I am still too busy tuning up five national assets to repair our country's fortunes, to be able to collect enough of the necessary to acquire a 'bus. May I suggest that if the gentleman has a spare one *(tax 30s.)* that he send it on to my address!

I have taken your paper every week for more years than I care to look back upon, and I still am greatly interested every Thursday. T.P.

Plumstead, S.E.18.

AUTOMATIC LUBRICATION.

Sir,—With reference to the oiling system described by your correspondent of the Doncaster Engineering Co., to my mind there are several points that warrant criticism.

First, unless a silencer with a very restricted outlet be employed, pressure above atmosphere in the exhaust pipe is only present, in the case of a single, during one out of four strokes of the piston. Any pressure created above the oil during the exhaust stroke would most certainly blow off, *via* the silencer, during the next three strokes. Inertia would not allow the oil in the "rising main" to rise and fall about one thousand times a minute. Thus, in order to get any oil to flow at all, a non-return valve *must* be placed in the small pipe leading from the exhaust to the oil tank. Any motor cyclist who has had experience of "small pipes leading from the exhaust" in connection with war-time paraffin gadgets will realise how soon these become blocked with carbon, even when unobstructed. Imagine what the result will be when the pipe includes a small non-return valve!

Secondly, supposing the maintenance of pressure in the oil tank to have been satisfactorily accomplished, on a cold day I wonder how much of the oil forced past the needle valve will flow "by gravity" to the engine, and how much will squirt out of the vent hole. My own experience suggests that 99% of the oil will come out of the vent.

Other disadvantages in the system as set forth by your correspondent are that the rate of drip cannot be inspected. Any loss of tank pressure due to obstruction of gas pipe, failure of non-return valve, or leaky joint of filler cap would at once cause a failure in the oil supply to the engine without the rider being aware of it.

Finally, I personally dislike the idea of contaminating the lubricant with sooty exhaust gas. K.B.

Liverpool.

[Our correspondent should note that the Peters machine, on which the lubrication system in question is embodied, is a two-stroke, and therefore a good deal of his criticism does not apply.—ED.]

PREVENTION OF CREEPING TYRES.

Sir,—As I have on many occasions derived benefit from "Ixion's" remarks, may I offer the following "tip" as a cure for creeping tyres, for, according to your issue of January 27th, he knows of nothing except the hated security bolt which will effect a cure.

Here it is, and please do not laugh till you have tried it, Mr. "Ixion": Purchase from any electrical engineering stores a coil of bitumen tape at least 1in. wide, such as is used for cable joints; ordinary insulating tape is useless. Remove tyre and wind this tape at least twice round the centre of rim, after which the valve hole can be punched through with any handy instrument. Fit tyre as usual, minus security bolts, and I will wager that neither violent acceleration nor thumping on top gear will shift a tyre thus fitted. Of course, this method is no good with a badly fitting tyre (security bolts will not hold that sort), but it *is* a cure for the average tyre which creeps.

With reference to a correspondent's desire for the publication of "Ixion's" portrait, my humble plea, with all due respect, is, please do not! S.A.B.

Harpenden.

ANOTHER SIDE OF THE MAGNETO QUESTION.

Sir,—Having read with interest your articles on the subject of protection for the magneto trade, I venture to give the opinion of a humble motor cyclist. Although quite realising the desirability of preventing Germany from regaining the monopoly of the magneto trade, I certainly think that the existing 33⅓% import duty should afford quite as much protection as is healthy for, and deserved by, the British manufacturers. There cannot be much doubt but that these have made big profits during the war, and if they find that, after six years' experience, they cannot produce a good magneto for less than 33⅓% in excess of the German trade price, then they cannot be worth any further protection or encouragement. The idea of raising the import duty appears to me to be merely an instance in which the Government is to co-operate with manufacturers in keeping prices inflated. We motor cyclists are admittedly an over-taxed body, and surely we ought to oppose, rather than advocate, this new scheme for preventing the initial cost of our machines from being lowered by a pound or two.

Personally, I have yet to find the British magneto which for genuine reliability is the equal of the Bosch.

South Hampstead, N.W.6. BROKE.

[In accordance with our usual policy of ventilating all sides of a possibly controversial subject, we publish the foregoing letter *in extenso*. "Broke," however, is almost alone in his views, and particularly so in his failure to find a British magneto as reliable as the German article.—ED.]

BALANCING OF ENGINES.

Sir,—I was much interested in the reference in the A.C.U. report of the Six Days Trial that "more attention should be paid to the balance of engines, especially at slow speeds."

As far as I can see, the more slowly an engine goes so ought the balance weight to approach that of the reciprocating masses. The faster an engine goes so ought the balance weight to approach that of half the reciprocating masses. That of course is referring to single-cylinder engines. I should like to know what the best compromise is.

I should also like to see described the differences in the balance of different types of engine giving the magnitude of the unbalanced forces and their effect in producing engine vibration. The effect of transverse couple on the Scott type of engine also puzzles me. I know there was an article on this subject before, but it did not go into detail enough.

Perhaps some mathematician will kindly oblige. R.E.C.

Ilfracombe.

[An article on the subject of balancing appears in this issue.—ED.]

WHY NO PRICES?

Sir,—May I be allowed to give vent to a good long "grouse"? I have read your journal from its first number, and learnt much from its interesting articles. This, however, is the first time I have ventured to write to you, and I do so in the hope that the various advertisers in your journal will "sit up and take notice." Like many hundreds of other motor cyclists, I can only afford a second-hand machine, so always look-out for little gadgets to improve its running.

Well, I look through the advertisements and find that Brooks advertise a cantilever saddle. Just the thing on these little pot-holey roads. Can I afford it? The advertisement gives no price, so I cannot tell. The same with the Degory carburetter, the Cox-Atmos, and the B. and B. Most of the advertisements that suffer from this omission are whole page, and give a whole lot of information, but omit the price. Besides the firms I have mentioned are the Burman Gear people, Maglita, Still windscreen, Tan Sad saddles and pillion seats, and many others.

The Sturmey-Archer people tell us to use no other gear, yet when I wrote to them they said that they could not supply me with a gear box inside twelve months, as their output was booked. On September 15th I sent 5s. for two valve air leak preventers, which were advertised as "delivery from stock." Three days afterwards I received a card promising delivery in fourteen days. Twice since then I have written, but the fittings are not to hand yet!

The Government tells us that we should as far as possible limit unnecessary expenditure, and yet all these firms insist that the readers spend one penny or twopence to find out the price of their articles.

I am convinced that such firms lose much custom, because many riders will not take the trouble to write and ask prices.

Where can I purchase a fifty-gallon drum of benzole?

Eastbourne. HC 1724.

SUGGESTIONS FOR THE 1921 ARBUTHNOT TROPHY TRIAL.

Sir,—I wonder if I might encroach on your space to put forward a few suggsetions in respect to the 1921 Arbuthnot Trophy Trial. This may strike you as being a somewhat peculiar time of the year in which to air my views, but my reason is that if I had done so immediately after last year's event everyone would have forgotten all about it by next year, and if I leave it much longer there will be no time to alter anything, in the (extremely unlikely) event of any of my ideas being acted upon.

I think most people will agree that last year's event was somewhat of a failure, bearing in mind what the trial could be if only it had a fair chance. No one is likely to deny that it was a thoroughly well run and sporting affair, and that the winner deserved every credit; but what I mean to say is that this trial should be the greatest amateur event of the year. Given a really good entry, there is no reason why it should not become a classic; at present it seems like degenerating into a farce. One cannot possibly blame the organisation, for the A.C.U. has done all it can to make things go, both in 1919 and 1920, and it would, I think, be somewhat unfair to blame the Navy for not providing sufficient entries. The sea is proverbially a fickle mistress, and it is impossible to arrange an event to fit everyone's leave.

After the 1920 event there was, I believe, some talk of augmenting the entry by allowing a certain number of amateurs outside the Navy to compete. Surely this would cause considerable difficulty, both in deciding who should and who should not enter, and also in defining our old friend the amateur—always a knotty point.

My suggestions are as follows:

(a) That the 1921 trial should be open to officers and men of the Royal Navy, Royal Marines, and Royal Air Force.

(b) That the trophy should be won by the best performance not of a private individual but of a team of seven, representing any of the above Services. Naturally, any Service could enter as many teams as it wished.

(c) In order not to exclude individual riders not sufficiently fortunate to be included in any team, a small separate award should be given for the best individual effort, and silver medals awarded to all those completing the course without loss of marks.

(d) That the dates and conditions of the trial should be announced as soon as possible and freely circulated amongst the Services, so as to give the event as much publicity as possible.

I certainly do not consider myself competent to suggest the form the trial should take. I was myself unable to compete in last year's event, but from all accounts it was a thoroughly sporting and enjoyable event, and needed no improvement save a larger entry. W. S. JAMESON, Lt. R.N.

We have forwarded a copy of our correspondent's letter to the secretary of the A.C.U., who replies as below:

"I entirely agree with Mr. Jameson that if possible the scope of the entry list should be increased so that enough entrants may be obtained to make the trial the success which it should be. The only difficulty is that the trophy was subscribed for by the public on the definite understanding that it was to be competed for at a trial open only to officers of the Royal Navy. Possibly a public announcement that the conditions of the trial were likely to be altered would satisfy any objectors.

"As regards Mr. Jameson's proposals in detail, I have not yet had an opportunity of submitting these to the Competitions Committee of the Auto-Cycle Union so I am unable to comment on them—otherwise than by saying they seem worthy of most careful consideration.

"T. W. LOUGHBOROUGH, Secretary,
"The Auto-Cycle Union."

The police in South Africa have thousands of square miles to cover, extending from Cape Town to Lake Nyassa, a distance of nearly two thousand miles, and the convenience of the handy motor cycle can well be imagined. The illustration depicts a police inspector with his B.S.A at Mengulat, Lake Nyassa.

THEORY AND PRACTICE.

Sir,—In your issue of December 30th there is a request by "A.S.," who wants to fit a switch to a magneto not adapted for one.

I was in the same difficulty many years ago owing to the choking up of a release valve passage on a two-stroke; and, against the advice of experts, I clipped to the tube beneath the tank a piece of spring steel or mudguard stay, which was pulled down into contact with the plug terminal by Bowden wire, and cable worked from the handle-bar.

This has worked as a perfect cut-out for years, and on several machines, apparently with no harm to plug or magneto. It is not in the way when the plug is taken out, nor is there any electric shock therefrom. DITTO.

Dublin.

LIGHTWEIGHTS FOR THE USE OF LADIES.

Sir,—As a reader of your valuable paper and a keen motor cyclist (solo), may I be permitted to say a few words. I think most ladies either do not ride because they don't like wearing breeches, or else they have not found a suitable machine.

I have now been riding some years. My first 'bus was a 1915 lady's open frame Velocette. I have since then tried various diamond frame machines, but still find I prefer to keep my little Velocette, alike for speed, easy starting, and above all as an absolutely no-trouble mount. I have no interest in Messrs. Veloce, and I simply write this letter because I believe, if more ladies knew of this real lady's mount, there would soon be a multitude of lady riders. I am convinced that what the lady requires is a lightweight open frame (very open to allow for riding in skirts as usually worn); she also wants a two-stroke because it starts easily and is simple to understand. Chain drive I consider best, as this form of transmission is more reliable. Automatic lubrication is essential, as on the Velocette all that one has to do is to put oil in the sump, and never think again about it.

I keep my little 'bus in the back kitchen, and if I have some shopping to do, I just take it out, paddle off from the saddle and away I go. I may also say that I get 160 miles to the gallon always, a Senspray carburetter being fitted. I may conclude by saying my husband was so pleased with the way my little Velocette behaves, that he has also got one, and his also is the open frame model, which he much prefers to the diamond pattern. (Mrs.) GLADYS BENNETT.

AN INGENIOUS EXPLANATION.

Sir,—*Re* the letter by "J.K.D.C." in your issue of January 13th, there are one or two things which your correspondent has not quite grasped.

The fact that motor cycle speeds in America are greater than over here is not due to any superiority in design or tuning. The reason is that the air on the other side of the Atlantic is altogether less humid, less damp in other words. Now, the chief factor militating against big speeds is the resistance of the atmosphere, which increases as the square of the speed. In other words, suppose at 10 m.p.h., the atmospheric resistance (or pressure against the direction of motion) were 1 lb. per square inch (this is a purely imaginary example), then at 100 miles an hour, or ten times this speed, it would amount to 10^2 lb. per square inch or 100 lb. per square inch.

Now, the American atmosphere, being dryer, has less retarding effect upon a moving body (not much it is true), and owing to the law of squares, this does not show up at all considerably, until fairly high speed has been attained. So it remains that c.c. for c.c. America will put up bigger speeds than we do, but if American machines were to race at Brooklands their speed would be found to have dropped very considerably.

One of the cars competing in (I believe) the Indianapolis races in 1914 put up much bigger speeds when it arrived in America than it had done on this side.

Harry Vardon, the famous golfer, says in his book that, when playing in America, he found that the drive which he was able to put up was always longer than he had been able to do in this country—another sphere in which the question of atmospheric resistance plays an important part, as we are told that the velocity of a golf ball on leaving the club, on a full drive, is about 300 miles per hour.

L. W. G. HARTLEY.

OVERSIZE TYRES IN BELGIUM.

Sir,—I am a regular subscriber of your very interesting paper, and note that plenty of your readers seem to be quite at a loss to understand tyre sizes and rims.

Will you allow me to tell you what my *actual* experience has taught me? I may say that living in Belgium obliges one to try a way out of the discomfort which is the rule if small tyres are fitted. Hence my knowledge is based on experience. Here are the results:

On the 26×2¼in. rim. (same as 4 h.p. Triumph) one may fit 26×2¼in., 26×2⅜in., 26×2½×2¼in. Dunlops, 750×75 mm. Hutchinsons small car type, and Firestone 28×3in. non-skid without difficulty whatever. The last named give splendid comfort on the Triumph. However, it is not possible to fit them on the front wheel, as they touch the bottom of the mudguard; also it is not possible to fit them on the back wheel of the Model H if the mudguard has been patched up or if the rim is badly out of truth. When fitting, the inner flange of the tyre must be cut with a knife round the place of the valve. English 28×3in. tyres are not satisfactory on the 26×2¼in. rim because they roll. On the new chain-driven Triumph one can put 28×3in. Firestone on both wheels easily. Also, on the 3½ h.p. Ariel one simply forgets all about punctures with them on! On the 26×2¼in. rims one can put 26×3in. English tyres, also 710×90 mm. Michelins.

On the 28×3in. American rims (American X, Harley-Davidson, and Indian) the 760×90 mm. Jenatzy go all right. It is also nice to know that the new 27×3½in. American rim is practically the British 26×2½in. rim, and if an English rider wants to fit an English sidecar to his 1921 American X, or Ace, or 1921 Henderson it will be an easy matter to match the sidecar wheels by fitting a 26×2½in. rim.

In the way of inner tubes, I found that the 26×2½×2¼in. *endless* tube fits the 28×3in. Firestone; the 26×2⅜in. endless fits the 26×2½×2¼in. Dunlop.

I believe in tyres pumped board hard on the back wheel, and I do not believe in taking girls for joy rides on the carrier if they do not sit properly—that is, facing the direction of travel. In Belgium and Holland there is no "pillion question" as one hears of in England, simply because passengers on the carriers do not do such silly things as to sit sideways. The danger comes from that practice and from nothing else. J. TAYMANS.

Brussels.

In France, where the roads are generally straight. One of the great main roads on the Continent, often traversed by British motor cyclists on their tours to the Alps and beyond.

STAND-PIPE PETROL SUPPLY.

Sir,—"Ixion" is asking in your issue of January 27th how one is served, and if any shortage results from the "bulk storage" and stand-pipe system of selling petrol in America.

From my experience out there I can safely say that you get the gallon every time, because your gallon is registered by a sight glass. To prove this system I have measured it after being supplied.

I cannot help but praise this genuine, quick and clean system of supplying petrol, and how crude our system of cans, waste, and mess; not forgetting that many will not split a can.

Again, every petrol supply station in America has the price per gallon displayed where all can see, another convenience all round. REGINALD GEARY.

TWO-STROKES.

Sir,—*Re* the remarks on "Four Stroking" by "July" and others, may I give what I think the real reason? It always occurs when going slowly on level and fast downhill.

The following given is the result of practical experiments. First, it is due only to bad scavenging, and it is only to be remedied by structural alteration provided to exhaust the burnt gas, and cannot be remedied by any amount of careful driving.

In the Dunelt engine we find a step in the right direction. Two-stroking does not depend on speed, but on throttle opening only. When going slowly on level and fast downhill the throttle is nearly closed, but go slowly uphill with a heavy load with full throttle and it will two-stroke. Assuming the piston is at the bottom with a cylinder of burnt gas at atmospheric pressure, the crank case is only partially filled, due to small opening. The small charge from the crank case pressure is not sufficient to expel the burnt charge, and is damped by it, but leaves a better charge ready for mixing with the next inflow from the crank case. "July," by fitting an extra air valve, helps the crank case to get a fuller charge to expel the burnt one, but it is a remedy that cannot be carried far, as the mixture would be too weak.

Radcliffe. ENGINEER.

DAYLIGHT INTO SOME TAXATION ANOMALIES.

Sir,—May I have the pleasure (as a motor cyclist and for many years a regular reader of your paper) of criticising the article which appears in the issue of January 13th *re* the new taxation?

I quite fail to see any difference between a fixed weight of 200 lb. or 2 cwt., because a pound over or under would be the factor in deciding the tax in either case. May I point out here that the 200 lb. limit is just the mark which covers practically all lightweights, and the raising of this figure to 2 cwt. would bring in the greater number of higher powered mounts, defeating the object in view, viz., revenue.

The little joke about the transportation of soil for weighing purposes is funny, but the motorist that would be caught under such circumstances should not only be a rarity, but decidedly unlucky also.

The contrast cited is that a cycle of 198 lb. (a lightweight) with a sidecar affixed weighing 120 lb., presumed to carry two heavy people, making about 6 cwt. and paying a tax of £2 10s., while a cycle of over the 200 lb. limit pays a tax of £3 and has no sidecar.

Well, I have very, very grave doubts if there is a machine anywhere so lightly constructed capable of such service with such a load for any length of time.

The issue of quarterly licences to motor cyclists would again defeat the objects of revenue. There would be by far the greater portion of licences issued in respect of short periods only. In addition to that there would be a considerable increase in labour involved in its collection. Further, the annual sum is not great if money value is taken into consideration.

The crumb of comfort with a sly dig about the tax for a motor bath chair is a little joke which neatly finishes the article signed by "Jam Satis," but it would cease to be an invalid bath chair attached to a machine and driven by other than the invalid.

But, in spite of all, we won the war. We are very much alive, and hope for some enjoyable runs on luxurious roads, and last, but not least, cheaper fuel. CHI.

Chichester.

MAGNETO ADJUSTMENT.

Sir,—I have just spent half an hour in endeavouring to adjust a magneto chain by means of the usual four studs in a slotted platform—the chief feature being that the process of tightening the studs upsets the adjustment.

At first this is wildly annoying, but after a time the would-be adjuster blasphemes, weeps, or goes into a trance according to his temperament.

As motor cycle designers apparently use Rolls-Royce cars, or leave their adjustments to uncomplaining mechanics, would it not be possible to start a list of these abominations which transform peaceable men into raging savages?

If readers would take part in the compilation of such a list we might in time eliminate some of these unmechanical devices so dear to the makers.

We could, at least, say that a machine contained such and such a number of these inanities which would form a useful basis for comparison.

If you will furnish me with the names and addresses of any "Constant Readers" who never experience trouble of this particular nature I will gladly do them to death in the most brutal fashion. P. WYAND.

[This letter was evidently written *before* Olympia, where several machines were shown with a simplified magneto adjustment. However, we are in entire agreement with our correspondent on the awkwardness of most existing designs. —ED.]

SUMMARY OF CORRESPONDENCE.

Further correspondents this week urge "Ixion" to give us a second volume of his reminiscences.

Several readers write to correct "Appreciative's" impression that his Rudge-Multi only weighs 188 lb. They state that this machine weighs 240 lb., and the 188 lb. weight applies to the single-geared T.T. Rudge.

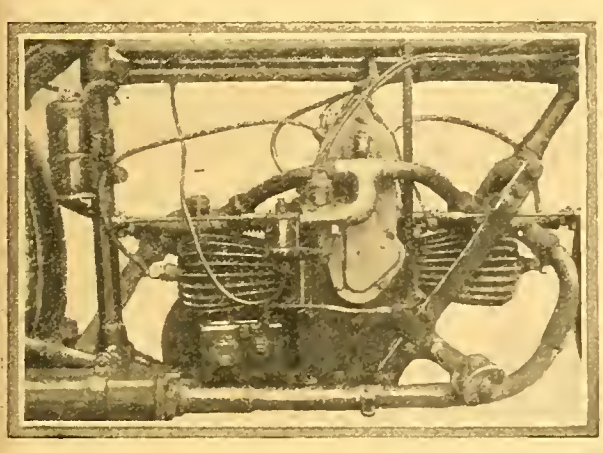
A correspondent, over the signature "Fortiter et Recte," takes seriously the humorous suggestion of "Jam Satis" in a recent article regarding taxation of motor bath-chairs. We had not thought it necessary to label the suggestion in question as in lighter vein, but we take this opportunity of very definitely stating that it was.

In the course of a long letter a correspondent, who signs himself "Troublesome," attempts to estimate the amount of trouble a novice may reasonably expect during his first twelve months' ownership of a good machine. One of his items (for 5,000 miles running) is: "Internal cleaning of crank case—twenty-five times." We trust he does not mean dismantling; but, even a thorough "swill out" every two hundred miles is more than most novices (or experts) of our acquaintance bother with. The rest of his list is similarly rather optimistic regarding adjustments, and pessimistic on actual trouble. We fear his letter, if published, would raise a shoal of claims from readers who have covered greater distances "without touching a spanner."

BOOKS AND MAPS FOR MOTOR CYCLISTS

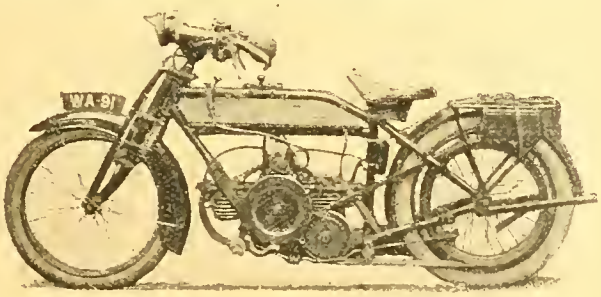
Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS" Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying them when found. Fourth Edition	2/-	2/3
"MAGNETOS." By A. P. YOUNG. A complete treatise on magneto ignition for motor cars, motor cycles, and aeroplanes	4/6	4/10
"MOTOR CYCLE REMINISCENCES." By "IXION," of *The Motor Cycle*	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS. **England and Wales. Scotland. London** (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District ..	5/-	5/4



Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C., 4, or of leading Booksellers and Railway Bookstalls.

A Home-made Flat Twin.



An Excellent Example of Design and Construction under Difficulties.

IT is not often that we learn of "home-made" machines which truly deserve their appellation. True, from time to time, various industrious readers forward particulars of mounts which they have assembled from component units, but the machines built throughout by private riders could be enumerated on the fingers of the hand, figuratively speaking.

Herewith, however, we are able to give two illustrations and some particulars of a decidedly attractive looking 3½ h.p. flat twin which has been almost entirely constructed by one of our Sheffield readers, Mr. W. G. Barber.

Power unit of Mr. W. G. Barber's machine made on a 5in. treadle lathe; the neat appearance and compact housing of the gear box are commendable features.

A Sheffield reader's machine, designed and constructed throughout by himself. It has a 3½ h.p. flat twin engine and two-speed gear box.

In the production of the engine and gear box, the entire machining has been carried out on a 5in. treadle lathe, and only those who have operated a tool of this description will appreciate the patience and physical effort summarised in that simple statement.

The engine capacity is 530 c.c. (71 × 67 mm. bore and stroke), and is unusual in that the exhaust valves only are overhead. The inlets are on the "top" of the horizontal cylinders and concentric with the exhausts. A single camshaft, with two cams, operates the four valves, and although the cylinders are staggered ⅜in., the valve chests are in line, thus allowing the induction pipes to be symmetrical. Plain bearings are fitted to the engine, which has a hardened nickel steel crankshaft of 1in. diameter.

Ubas steel is employed for the pinions in the two-speed dog clutch gear box, and the casing of the latter is a one-piece malleable casting.

Re-enamelling the Motor Cycle at Home.

A Spare Time Task which may Save the Equivalent of the Tax.

NOW that the days are drawing out again one's thoughts turn to the open road, but motor cyclists still have time to turn some attention to details which occupy valuable riding time if undertaken during the summer months. I give below some directions for re-enamelling a machine, which, if carefully followed through, will bring abundant satisfaction and pleasure to the keen rider.

Preliminary Tasks.

To begin with, the first thing to decide is the proposed colour. This settled, work can begin at once, the time whilst waiting for the necessary enamels, etc., to arrive, being occupied by getting the machine as nearly ready as possible. Both tanks (oil and petrol) should be emptied, after which a small quantity of paraffin should be introduced into the oil tank; this, when pumped through to the crank case, assures one that everything is clean in the oil container, greatly frees the engine on rotation, cleans the flywheels, and allows all thick oil to be drained from the crank case. Now commence dismantling, by taking engine out, tank, back and front wheels, mudguards, etc., off, until the bare frame is left standing on front and rear stands. A word of advice here. Some people advocate putting all small nuts and bolts carefully away in a box by themselves. This is quite good, but to anyone who has not taken his particular machine to pieces before, I always advocate "a second sight" principle, *i.e.*, putting nuts and bolts back on parts to which they belong.

Now examine the frame. If the enamel is badly chipped or cracked, then there is nothing for it but to commence scraping, as a good surface is essential. This takes time, and sometimes appears hopeless, but if the "blood is warmed up" to it, it is surprising how quickly this—the worst part of the job—can be overcome. Follow this up with a good smoothing down with fine glass paper, carefully removing afterwards all traces of dust. The frame is now ready for the first coat—a start always being made by applying what is called a "priming coat," and *not* glass enamel, which is only for second and third coats. Whilst—generally three days—this is drying (covered by a newspaper to prevent dust settling), attention may be turned to the other parts, such as the carrier and mudguards, and all parts which require replating should be carefully noted, and delivered to the platers. By the time this is done the frame will be dry, so carefully "flat" this off with fine pumice dust on a wet cloth (to prevent scratches): then wash off clean and dry, and apply first coat of "gloss," taking care that as thin a coat as possible is applied. Three more days are required for drying, and so in the meantime attention may be given to the engine—decarbonising, freeing piston rings, cleaning carburetter, and adjusting magneto—getting all ready for reassembling.

The Final Coat.

When the second coat is dry, "flat" this off again as with the first coat, the result being that now there is a lovely surface on which to put the third and last coat. This should be a fairly full one, and it is the one for which all previous preparations have been made and on which results depend. Allow this last coat of enamel to dry thoroughly, after which—as it is no use spoiling the ship for a hap'orth of tar—and it is a sure preventive from the rain spot trouble, apply a coat of transparent varnish, which, when dry, bathe off in clear cold water. The nett result should be a beautifully finished frame, hard wearing.

With regard to materials and expense, the writer (using Robbialac) spent 12s. 2d. on enamels, brush, and postage, and another 10s. covered all the plating that was necessary. Altogether, it was time and money well spent—the machine being "pounds" better in appearance, not to mention the satisfaction at having carried the work through successfully.

The A.C.U. Six Days.

Shall we see small four-wheeled cycle cars in this year's A.C.U. Six Days?

Car Practice.

On page 164 of this issue we publish an article on a question of embodying car features in motor cycles.

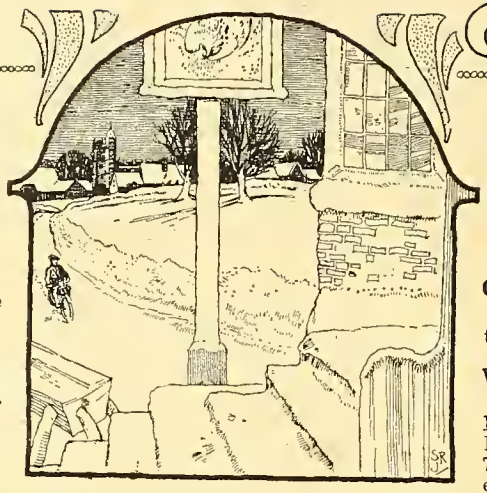
A 2¾ h.p. A.J.S. for 1921.

We learn that it is the intention of Messrs. A. J. Stevens, Ltd., again to market a 2¾ h.p. A.J.S. The popularity of the pre-war machine of this type, and the successes attained with its predecessor, including winning last year's T.T., make this news particularly interesting to solo riders.

Reduction in Price.

Motor Transport, hitherto fourpence, will from February 21st be reduced to threepence per copy. This reduction should, if this is possible, increase even further the wide sphere of influence of this publication, which deals with the many phases of industrial transport—an important and ever-widening movement in these days.

Prejudiced Public Bodies.



Various Corporation Bills affecting motoring interests have gained the attention of the Motor Legislation Committee as well as the A.A. An important point is made when it is stated that "public bodies owning tramways are unable to take an impartial view respecting the regulation of other forms of vehicular traffic."

Motor Cycling in Italy.

We have already referred to the progress of the sport and pastime in Italy. In an Italian paper we notice references to the Rex, Indian, Triumph, Excelsior, Ariel, Martinsyde, Wooler, Clyno, B.S.A., Matchless, Harley-Davidson, and Royal Ruby, in addition to motor cycles manufactured in Italy. This shows, therefore, that British and American machines are popular in that country.

Separate Organisation in the North.

Last Saturday's issue of *The Autocar* contains a report of the situation which has resulted in the severance of the North-Eastern Automobile Association from the R.A.C., to which it was affiliated. The Northern body, at a meeting in Newcastle-on-Tyne on January 29th, adopted a resolution to the effect that it should call upon its committee "to devise ways and means of serving its members as an independent organisation." How this resolution will affect the motor cycle section of the N.E.A.A., which is affiliated to the A.C.U., and to which some of the 1921 open competitions have been allotted, remains to be seen.

Good!

In the A.C.U. One Day Trial on April 27th, three and four-wheeled cycle cars will compete side by side.

The Tax on Auto Wheels.

There has been no little confusion regarding the taxation of tricycles fitted with Auto wheels. Some authorities have demanded £6, as for a car, and others have considered it to be a sidecar for taxation purposes. We are now informed by Major Watling, the manager of the Manufacturers' Union, that the Ministry of Transport has come to a decision on the matter, and that all local registration authorities have been advised that, whether fitted to a tricycle or a bicycle, the taxation is £1 10s.

Special Features.

THE SIDECAR ALTERNATIVE.
CAR PRACTICE OR SIMPLICITY.
THE DISC WHEEL VOGUE.

Cycle Cars of Long Ago.

On page 157 of this issue we illustrate two cycle cars on the market in 1900.

What is a Cycle Car?

At present, it is apparent that the R.A.C. and the A.C.U. are accepting the F.I.C.M. definition of the cycle car, *i.e.*, 772 lb. weight maximum and 1,100 c.c. engine limit.

The Paris-Madrid Trial.

We are informed that the Royal Spanish Motor Cycle Club has undertaken to help in the organisation of the above, after the Spanish frontier has been crossed, looking after the replenishing depots and supervising the trial throughout the remainder of the course. At the start, assistance will be given by the Sporting Club, aided by the Motor Cycle Club de Boulogne et de Billancourt, and the Motor Cycle Club de Montmartre. From Chartres the organisation will be carried on by the Western Automobile Club. At Poitiers the Union Vélocipédique de France will give its assistance, and at Bordeaux help will be given by the Bordeaux Motor Cycle Club.

SURPLUS GOVERNMENT ROADS!

The many ex-D.R.'s amongst our readers will, we are sure, feel quite home sick after looking at the photograph reproduced above. It was not taken in devastated France, however, but shows the present condition of the main roads in the New Forest just west of Southampton. This surface was produced during the building of two aerodromes

T.T. Aspirants.

Evidently a great many of our readers have T.T. aspirations, for we have received names for our T.T. register by every post since the publication of the original paragraph. Our long list now includes a number of riders with previous, and in some cases very successful, experience in past races in the I.O.M., and others whose names are almost by-words in the Brooklands and "hill-climb" side of the pastime.

High Averages.

It has long been a somewhat moot point as to which quality in a machine is the more favourable to a high average speed —acceleration or sheer maximum speed. However, there is a third essential to rapid transport even more important than these two, and it is a factor that some designers of "efficiency" mounts are inclined to give but very secondary consideration. We refer to brakes. Especially on a big machine it is an infallible rule that the better the braking system, the better the journey.

The Scottish Motor Cycle Show.

On Wednesday of last week, during the Scottish Show in Glasgow, a deputation representative of the motor cycle trade in Scotland waited on Mr. D. A. Fairley, secretary of the S.M.T.A., regarding the possibility of running a motor cycle show concurrently with the car show next year. The deputation was very favourably received by Mr. Fairley and several of the leading members of the Scottish M.T.A., many of whom appear to be very much in favour of the scheme, and we shall in all probability see a Scottish motor cycle show next year.

Courtesy.

We have received a letter from the secretary of the A.A. which includes the following paragraph: "When meeting other cars my head lights go 'off' in good time. This invariably brings an answering courtesy; if not, up they go again for a second, and that teaches yet another driver what should be done." We are urged to support the practice mentioned. Though we are always anxious to encourage courtesy on the road we take the liberty of reminding Mr. Stenson Cooke that owners of acetylene lamps (and there are many) are unable to dim their lights on the approach of other vehicles, and that if they are to be "punished" as suggested the chances of confusion are considerably increased. Surely it is up to us to be as courteous as possible and trust that others also will do the same. What do our readers say?

Death of Pioneer.

We regret to record the death of Mr. W. Hillman, one of the pioneers of the cycle and motor industries in Coventry. He was one of the founders of the Premier Company.

Prices.

Further to our recent paragraph referring to the policy of manufacturers and agents who are undertaking to indemnify purchasers of machines which before a certain date are reduced in price, we are able to state that other concerns are now giving a similar guarantee. Among these are the makers of the Royal Ruby and the Ariel, and the well-known Midland agent, Frank Whitworth.

Two-stroke Motor Cycles.

We learn from our publishers that the first edition of "Two-stroke Motor Cycles" is now ready, and copies may be obtained from Iliffe and Sons Ltd., 20, Tudor Street, London, E.C.4, price 3s. net, by post 3s. 3d. This book, which has been prepared by the staff of *The Motor Cycle*, deals fully with this fascinating type of machine, and should be found helpful to all owners of two-strokes as well as to prospective buyers.

TRADE NUMBERS.

In future policemen will have no difficulty in recognising trade numbers on a machine undergoing test. Here we have a little Triumph Junior bearing the new official plate, which, incidentally, may be used in official reliability trials. Placed a little higher over the handle-bar it might almost be used as a screen!

A.C.U. General Committee Meeting.

Possibly the most generally interesting subject for discussion at the forthcoming meeting of the A.C.U. General Committee is the proposed revision of the law as to the speed limit and driving licences. Several Centre byelaws and open competition rules are also down for consideration, with a view to possible detail amendment. This meeting will be held at the Clarendon Hotel, Shrewsbury, on the 12th February at 11 a.m.

Four-wheeled Cycle Cars.

At the meeting of the Committee of the R.A.C. held last week, it was agreed that temporarily, until the question of the line of demarcation between car and cycle is settled internationally, the R.A.C. will favourably consider applications for permits for small four-wheeled vehicles coming under the definition of the Fédération Internationale des Clubs Motorcyclistes to compete in Auto-Cycle Union Competitions in 1921.

Oil in Australia.

The Agent General for Western Australia has stated that the Anglo-Persian Oil Co., Ltd., is proposing to engage in oil mining in that State. The company is entirely British, and its aim is to develop oil fields within the Empire so as to make Great Britain independent of foreign supplies. The Anglo-Persian Oil Co. is already committed to the oil refining business in the Commonwealth, and it is proposed to establish a refinery in Victoria for the refining of imported crude oil until an internal supply of petroleum is available.

A Fallacy.

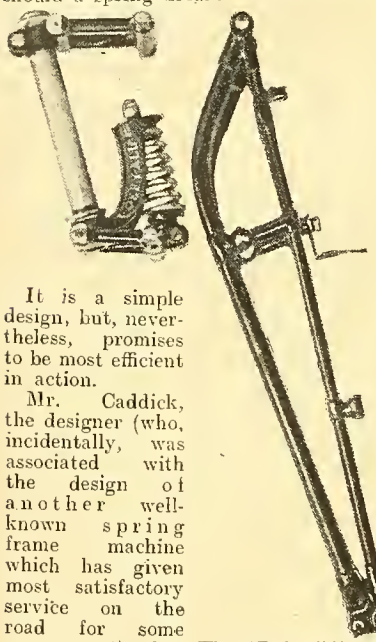
Although the figures given by the Rev. J. M. Philpott (page 167) in his endeavour to classify the performances in the last Six Days Trial are interesting, they cannot be taken as conclusive, since the formula used places undue value upon the speed figures at Brooklands. It must be remembered that the requirements demanded certain minimum speeds for each class, and no credit was implied in the regulations for speeds in excess of these. Obviously a cautious rider who was content merely to tour round the track at his qualifying speed is disadvantageously compared with the reckless rider who could not resist the track's "all out" invitation—hence the Rev. J. M. Philpott's formula as applied to the 1920 Six Days results is valueless, but would form a useful basis of comparison in future events run under suitably framed regulations.

CYCLE CARS IN A.C.U. TRIALS.

AT last the small four-wheeled cycle car is to be given a chance in open competitions. The R.A.C. has given permission to the A.C.U. to include this type of vehicle in the cycle car class in the Spring One Day Trial to be held on April 27th. It will be remembered that *The Motor Cycle* has urged such a course. Furthermore, we urged the institution of a weight limit.

This weight limit has been fixed at 350 kilos. (772 lb.). The present F.I.C.M. cycle car definition and classes for both solo and two-seater models are to be included.

Brooklands will play an important part in this trial, and, although we do not expect a freakish course, it should be an interesting event, if the regulations are any guide.

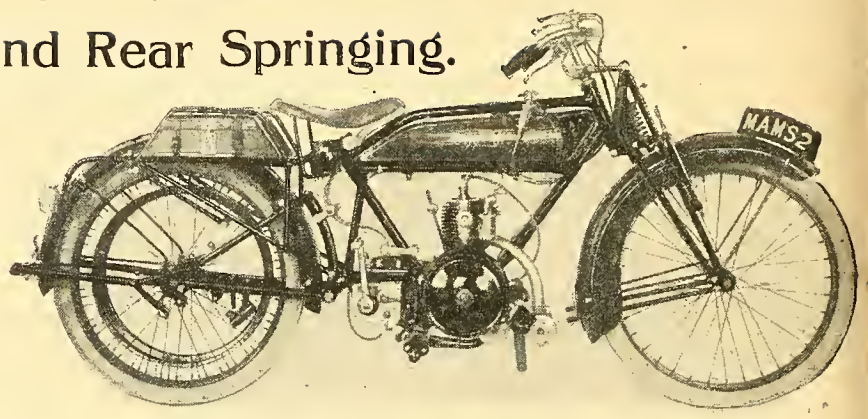


There is an impression that this is a trial for stock machines only. This is incorrect. Entries must conform to F.I.C.M. and A.C.U. open competition rules as regards equipment, and there is to be a special certificate of merit for all successful motor cycles that are really stock machines. These will be chosen from agents' stocks, but details as to this have yet to be arranged.

Manufacturers who wish to enter standard stock machines for this award must notify the Union before the 31st of March. Ordinary entries close on 9th April, and late entries may be received up to mid-day of 16th April.

Simple Front and Rear Springing.

The Defy-all Lightweight—the Product of a Well-known Designer.



PERHAPS the most interesting point of the Defy-all spring frame, apart from the refreshing originality of its carrier design, is the fact that it may be locked up solidly as a rigid assembly should a spring break.

The "Defy-all" spring fork dismantled.

It is a simple design, but, nevertheless, promises to be most efficient in action.

Mr. Caddick, the designer (who, incidentally, was associated with the design of another well-known spring frame machine which has given most satisfactory service on the road for some years past), has followed the usual practice of pivoting the rear stays just behind the gear box. Another pair of stays and a curved vertical tube complete the rear wheel member. The curved tube is linked to a very much "humped" four-leaf spring, which, in turn, is housed at one end just behind the saddle-pillar, and at its lower extremity is linked to the saddle tube.

With the carrier part of the main frame, the Defy-all lightweight leaves only the rear wheel unsprung.

Insulating the Rear Lamp.

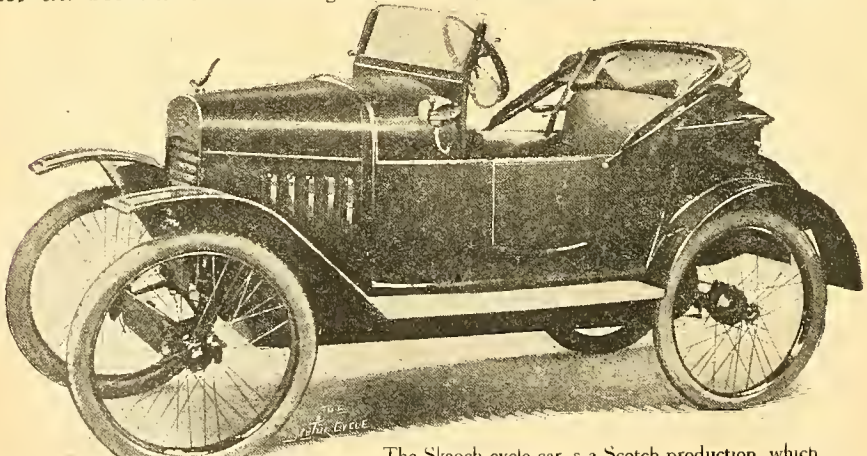
The carrier is an independent structure attached rigidly to the sprung portion of the frame, and so designed as to allow ample clearance for the moving wheel and mudguard. A special extension of the carrier is provided to carry the rear lamp—a commendable feature, as lamps attached to spring wheels usually receive much more vibration than is good for them.

In the illustration, the frame is shown in its "free" or springing form. It may be made rigid by attaching at one end the auxiliary struts on the lower carrier stays to bolts at the wheel spindle.

Also extremely simple, the front forks of this machine work on the parallel link principle. A special housing extending upwards from the base of the steering head holds the single coil spring in a very neat manner.

At present the Defy-all is only made as a lightweight, but we understand that mediumweight and heavyweight models are on the stocks.

On the existing machine, such well-known components as the 2½ h.p. Villiers engine, Amac carburetter, and Sturmey-Archer two-speed gear box, help to form a very taking little machine both in appearance and design. It is possible, however, that later editions of the lightweight will be fitted with 2¾ h.p. Blackburne engines.



The makers are the Defy-all Cycle and Motor Cycle Co., Ltd., Chapel Street, Stalybridge, Cheshire.

A Scottish Light Four-wheeler.

The Two-seater Skeoch Cycle Car—a Newcomer at the Glasgow Show.

ITS success as the power-unit of many lightweight sidecar outfits has often in the past caused us to wonder why so few designers have considered the 350 c.c. Precision two-stroke engine for an ultra-simple cycle car. We may no more wonder: for another four-wheeled two-seater with this engine has appeared.

Glasgow Automobile Show saw its *début*; and, incidentally, Scotland is the land of its birth. The Skeoch, as it is called—only a Scotchman could pronounce it correctly!—sells, complete with hood and screen, at £180, and is not without interesting, even unique, features of design.

The Skeoch cycle car is a Scotch production, which has a 350 c.c. two-stroke engine.

Three Drives.

Two speeds are provided by a Burman gear box, while the final drive is by belt and then by chain to a solid rear axle. Four very slender-looking quarter-elliptic springs support a simple "chassis," with side members of ash, while the body-work, though plain, appears neither unsymmetrical nor comfortless.

Mudguarding, although simple, should be quite efficient.

Lever Engine Starter.

The Skeoch possesses a long lever engine starter and two external contracting band brakes on the rear wheels. At £180, or £165 less lamps, etc., it appears to be excellent value, although, of course, this is considerably more than a sidecarette with a similar engine. The makers are the Skeoch Utility Car Co., Dalbeattie, Scotland.

A.C.U. WESTERN CENTRE OPEN TWO DAYS TRIAL.

REGULATIONS and route of the A.C.U. Western Centre two-day trial have now been issued, and contain several novel points of quite general interest. Especially is this so of the checking system. Briefly, this method, which is well-known to competitors in Scottish trials, but has not previously appeared in an important English event, means that checks are independent of one another, and that time lost or gained on one check cannot be made up or lost again on the next. Additionally, any competitor who is more than one hour behind his schedule time at the end of the first day's run must automatically retire.

The route, with which we will deal more fully at a later date, is from Hereford to Aberystwyth and back; but, although "stunt" hills have been excluded, it is by no means a straightforward tour. There will be eight test hills, and, to qualify for a premier award, competitors must make clean ascents on all of them. An attempt is made in the regulations to emphasise the difference between "footslogging" and steadying, and riders are advised to avoid the latter to be free of suspicion of the former.

A.C.U. Centre Championship.

A most imposing award list has been drawn up. In addition to the usual gold, silver, and bronze medals, there are the following special awards: Club team prize, A.C.U. Centre team championship prize (the three riders constituting a centre team must be drawn from any three clubs in any recognised centre), the White challenge cup (for the most outstanding solo, sidecar, or three-wheeler performance), "four-wheeler" challenge trophy (cycle cars, light cars, or cars), Sunbeam gold medal (best motor cycle performance on hills), amateur prizes, lady's prize, and, finally, a club gold medal for best individual performance by a member of each club in the centre. These latter awards will be presented by the individual clubs themselves.

THE MOTOR CYCLE GRAND PRIX.

AS already mentioned in *The Motor Cycle*, the Motor Cycle Grand Prix will be run on a circuit near Le Mans on Saturday, July 23rd, the day before the car race, for a distance of about 300 kilometres for motor cycles of 350 c.c. and 500 c.c., and about 250 kilometres for motor cycles of 250 c.c. The cost of entry is fixed at 400 francs. The race is open to manufacturers and owners of motor cycles. These latter will have to produce a certificate from the manufacturers of their vehicles. Entries are unlimited, and may be received at single fees up to May 31st, six o'clock in the evening, by the secretary of the Union Motocycliste de France, 8, Place de la Concorde, Paris. After May 31st up to June 30th at six o'clock entries will be received at double fee.

If, after June 30th, the number of entries is considered to be too high, the Competitions Committee of the U.M.F. reserves to itself the right to reduce the number by elimination.

Important to Competitors.

Motor cyclists entering must conform to the International Regulations decided upon at the last F.I.C.M. meeting at Brussels. Competitors will only be allowed to take part in the Motor Cycle Grand Prix if, on the day the machines are weighed in, they are furnished with a certificate from a mining engineer (French) certifying that the vehicle entered complies with the conditions.

The Competitions Committee reserves the right to withdraw a competitor who is considered unsuitable, in the interests of the security of the public or of other competitors.

The course adopted for the race will be exceedingly fast. It is roughly triangular in shape, practically level, and having no railway crossings, and only three turns which really call for skill on the part of the rider.

The term "Grand Prix" is so commonly employed in France that the British motor cyclist may be excused for not completely understanding the respective values of the various events appropriating this title. There may be a dozen Grand Prix of the "Slocum-cum-Slocum" type, but there is only one Grand Prix of the Union Motocycliste (the national body), and it is this event which constitutes the blue riband of the motor cycle world.

INTERNATIONAL MOTOR CYCLIST DELEGATES AT THE F.N. WORKS on the occasion of the recent F.I.C.M. meeting at Brussels. (1) Mr. W. H. Wells, Motor Cycle and Allied Trades Association of America. (2) Mr. T. W. Loughborough, Secretary, F.I.C.M. (3) Mr. E. M. P. Boileau, Auto-Cycle Union. (4) M. M. Fagard, F.M.B. President. (5) M. N. Kindberg, Swedish Motor Cycle Club. (6) M. E. Host, Danish Motor Cycle Union. (7) Mr. A. V. Ebblewhite, A.C.U. Timekeeper. (8) M. Marcellis, Timekeeper of the F.M.B. (9) M. Thuilier, Manager of the *Journal de Liége*. (10) M Collignon, F.M.B. (11) M. Renson, Sporting Editor of *La Meue*. (12) M. Galopin, Managing Director of the F.N. (13) M. Joassart, General Secretary of the F.N. (14) M. Nepper, Assistant Manager of the F.N. (15) M. Meyhi of the F.N. (16) M. Kelecom of the F.N.

THE ONLY TWENTY-FOUR HOUR OPEN TRIAL.

EALING and District M.C.C. are organising the only twenty-four hour open trial of the year. The route has just been published, and will be dealt with in detail later; but it may be stated that with the exception of a short stretch between Llanidloes and Machynlleth no freak surfaces are encountered, and the whole run merely consists, from Hereford onward, of a long series of stiff climbs which will prove an excellent test of the efficiency of any type of machine.

Furthermore, every type of rider is catered for, and the rider who has never yet obtained an award in a trial is given a slight advantage.

Cups, prizes and a challenge shield are being presented for the best performances, being divided up as follows:—

Best individual performance.
Best performance by an amateur.
Best performance by a private owner.
Best performance by a trade team.
Best performance by a private team.

Many inquiries have been received regarding this trial and a very large entry is expected.

The start will take place from Cranford Bridge Hotel at midnight on April 15th.

B.M.C.R.C. ANNUAL GENERAL MEETING.

THE annual general meeting of the B.M.C.R.C., which was held at the end of last month, marked the conclusion of a very successful year. So far as the officers and committee are concerned, the following were elected: President, Brig.-Gen. Sir H. Capel-Holden; vice-president, Col. F. Lindsay Lloyd, C.M.G.; hon. secretary, Mr. T. W. Loughborough. The committee consists of the following members: Chairman, Mr. A. V. Ebblewhite, and Messrs. F. W. Barnes, S. F. Garrett, F. A. Hardy, W. A. Jacob, F. A. McNab, W. Pratt, A. G. Reynolds, W. H. Wells, and E. B. Ware.

At the meeting it was decided on the following classes of membership: Trade members, subscription five guineas; private members, three guineas; and members who are also of the Brooklands Automobile Racing Club, two guineas. Any candidate for private membership must sign a declaration as follows: "I hereby declare that I am not now either a manufacturer of, or agent for, or dealer in, motor cycles, or motor vehicles, or any articles allied to the motor industry, nor an employee of any firm or company engaged in such trade or trades, nor will I accept any financial assistance of any kind whatsoever from any person or persons interested in or associated with the motor or allied industries. I undertake if elected, and in the event of any amateur status thus defined being in any way modified during the club year ending 31st December next, forthwith to acquaint the secretary with the circumstances, and if required to pay the difference between the rates of subscription payable by trade and other member."

It was decided that any trade member under the above definition who does not intend to use the track for racing purposes shall be held to be a private member until such time in any year when he does so use the track.

CLUB NEWS. (Continued from page 168.)

Sutton Coldfield and North Birmingham A.C.

The above club will hold the Colmore Cup Trial on March 5th next. All information, entry forms, etc., may be obtained from the hon. secretary, Mr. Phil Mosedale, the Nook, Maney Hill Road, Sutton Coldfield.

Western M.C.C. (Glasgow).

Over £400 worth of prizes and medals, the awards for last season's competitions, are to be presented at the second annual dinner of the Western Motor Cycling Club, which will take place at the Grosvenor Hotel, Glasgow, on Saturday next, 12th inst.

Ilkley M.C. and L.C.C.

The Ilkley Motor Cycle and Light Car Club, one of the healthiest of the Yorkshire clubs, was shown to be in a very flourishing condition at the annual meeting held on January 31st. Not only had they paid their way during the year, but they had actually made the open trial—one of the best one-day open trials of the country—pay for itself. Capt. J. N. Longfield was re-elected president of the club with Mr. H. W. Sellers as hon. sec. and treasurer.

Birmingham M.C.C.

A good proportion of the 333 members of the Birmingham Motor Cycle Club attended the eighteenth annual general meeting, held at the Imperial Hotel, Birmingham, on Monday, January 31st.

The election of officers for the year resulted as follows: Captain, Mr. R. W. Duke; vice-captains, Messrs. W. H. Edwards and T. F. Watson; social secretaries, Messrs. C. Browne and E. Danks; trials secretaries, Messrs. L. Clarke, W. S. Banner, S. Haden, sen., and S. C. Toye; press secretary, Mr. G. R. Morgan; treasurer, Mr. E. W. Winckle; secretary, Mr. W. H. Egginton.

Stamford and District M.C.C.

A company of over forty attended the first annual dinner of the Stamford and District M.C.C., which took place at club headquarters, the Crown Hotel, Mr. D. L. Simpson presiding. During the evening the Stamford Challenge Cup was presented to Mr. Turnill, a representative of the winners, the Peterborough M.C.C.

Burnley and District M.C.C.

At the annual general meeting held at the Café Royal on February 2nd, the following were elected as officials for 1921: President, Alderman E. Whitehead, J.P.; vice-presidents, Messrs. W. Catlow and B. S. Cooper; secretary, Mr. J. R. Ashworth, 58, Colne Road, Burnley; assistant secretary, Mr. E. Pool; treasurer, Mr. W. Easton.

Lewes and District M.C.C.

The old Lewes Motor Cycle Club has been revived, and starts with a membership of over fifty. A whist drive held recently was a great success. Owners of light cars and cycle cars not exceeding 10 h.p. are invited to join. The programme will include social runs and competitions. Those wishing to join should communicate with Mr. G. E. Stacey, c/o White Hart Hotel, Lewes.

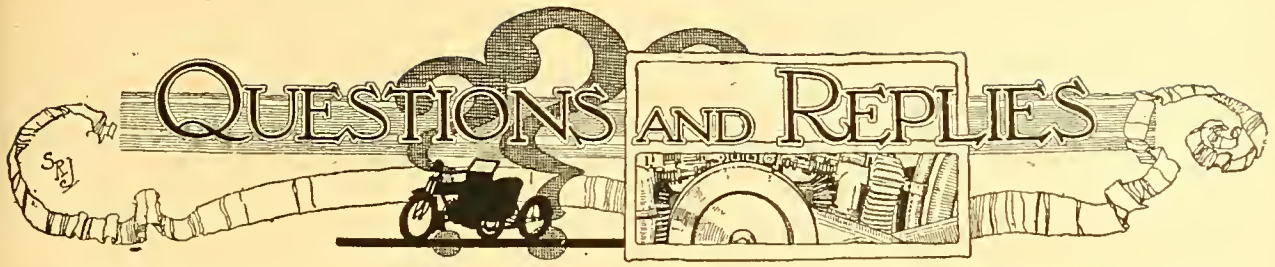
North-west London M.C.C.

When old companions meet after six years things usually go with a swing, and under these circumstances the informal supper at Golders Green was thoroughly enjoyed by forty members on Wednesday, the 2nd inst. The finish up at the Hippodrome, where seats had been reserved, was voted thoroughly enjoyable. Mr. O. Hill, 3, Old Bond Street, W., will be glad to hear at once of all members (other than those who have already notified) intending to attend the annual dinner on March 2nd.

Proposed Hertford and District M.C.C.

A meeting will take place at the Coffee Tavern Hall, Hoddesdon, on Tuesday, February 15th, at 7.30 p.m., to discuss formation, etc., and it is hoped that all motor cyclists in the district who are interested will put in an appearance.

The Brookdale Club (Motor Section).



The above club, with its spacious headquarters at Brookdale Road, Catford, S.E. (rear of Town Hall), is holding a rally at Keston Lakes on the 13th inst., with a view to re-forming its motor section. Any motorist interested will be welcome to this rally, or to a meeting at headquarters on Wednesday evening, the 16th inst., at eight o'clock.

Essex M.C.

Intended to demonstrate the capabilities of modern vehicles under ordinary touring conditions, the one-day winter trial, to be held on February 19th, will not include freak hills or secret checks. It is open to motor cycles and sidecars of members only, but the cycle car and car classes (under 1,500 c.c.) are open to all. Acceleration, flexibility, and brake tests are included.

Cumberland County M.C.C.

At the annual dinner of the Cumberland County M.C.C., Mr. W. Theodore Carr, M.P., as president, took the chair. Others present included the Chief Constable (Mr. Eric H. Spence), Mr. T. Gigson (the retiring captain of the club), Mr. J. J. A. Dias (the new captain), Mr. H. A. P. Mawson (secretary), Mr. W. B. Anderson (treasurer), Mr. T. B. Westmorland, Dr. Doughty, Mr. H. C. Simpson, Mr. Thompson, Mr. C. G. Brooks, Mr. J. G. Bell, V.S., Mr. Alfred Sutton, and Mr. W. N. Simpson, and Mr. John Robinson, representing the Western Motor Cycling Club, Glasgow.

A selection of questions of general interest from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the top left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

A SIDECAR CONVERSION.

(I.) Could I fit a 1920 4 h.p. Douglas standard sidecar to a 1921 8 h.p. New Imperial (solo) without it being out of alignment? (2.) If so, should I need any extra sidecar arms or bolts?—J.R.J.

(1.) It is most unlikely that you would be able to fit a 1920 4 h.p. Douglas sidecar to a 1921 New Imperial machine, as the sidecar attachments are specially made to suit the Douglas motor cycle frame. (2.) A good mechanic might be able to effect the fitting, but it would not be done without considerable trouble and expense.

GENERATING FROM MAGNETO.

(I.) What voltage is given out by the low-tension coil of a magneto? (2.) Could the electricity be stored in an accumulator, and if so, what would its voltage have to be? (3.) Would a choke coil be required when using an accumulator?—J.M.

(1.) Probably about four to six volts, but no definite figures are available for all types; a test would have to be made. (2 and 3.) As the primary current of a magneto is alternating, it cannot be used for accumulator charging, unless special arrangements are made to include a commutator in the apparatus.

TYRE SIZES AND CLUTCH MANIPULATION.

(I.) Can I safely fit 28×3in. tyres on the 26×2¼in. rims of my 1914 3½ h.p. Sunbeam? (2.) Is it good driving to use the exhaust when cornering, slowing down, or coasting downhill? (3.) When kick starting from the near side of a well cambered road, why does my gear invariably jump from neutral into low before I touch the gear lever or raise the clutch?—SUNBEAM.

(1.) Provided there is sufficient clearance between the rim and the mudguards, you should be able to use 28×3in. tyres on your 26×2¼in. rims. At the same time the tyre makers do not recommend the fitting of this size of cover to such rims, but it is very frequently and successfully done. (2.) There is no objection to using the exhaust valve when coasting downhill, but in all other circumstances with a three-speed machine and handle-bar clutch such as yours, it is better to use the throttle or clutch according to circumstances. (3.) In all probability this is due to wear of the gear operating mechanism, and it may be necessary to replace the dogs and the selector fork in the gear box.

NO TAX ON MACHINE IN STORE.

I have a motor cycle which I do not intend to use again, as I am going to sell it in the spring. Shall I have to pay the new tax? I shall not use it on the roads, and as I intend to buy a new one before Whitsuntide I don't see the necessity of paying twice.—J.A.Y.

If you do not use the machine on the roads, you need not take out the tax, but you will understand, of course, that you will be unable to demonstrate the machine on the public roads to a prospective purchaser until the tax is paid.

Important Dates.

Feb 21st-28th—
Paris-Nice Trial.

March 28th—
Richmond Meet.

March 26th—
M.C.C London-Land's End Trial.

April 27th—
A.C.U. One-day Winter Trial for Stock Machines.

May 14th—
M.C.C. London-Edinburgh Run.

May 25th—
A.C.U. Silencer Trial—Brooklands.

June 14th-16th—
Tourist Trophy Races.

June 25th—
M.C.C. Inter-team Trial for "The Motor Cycle" Cup.

July 6th-7th—
Arbuthnot Trophy Trial for Naval Officers

July 23rd—
Grand Prix Race—Le Mans.

August 1st-6th—
International Six Days Trial—Geneva

August 28th to Sep. 3rd—
A.C.U. Six Days Trials.

Sep. 17th—
Grand Prix Race for Cycle Cars.

THE RESULT OF PRE-IGNITION.

I have a 2½ h.p. Villiers two-stroke which gave no trouble for three years until lately. Last week, owing to pre-ignition, the flywheel key sheared. After fitting a new key the engine knocked very badly. Immediately the release was lifted, however, everything seemed all right; the engine was retimed without result. On dismantling, very little play was found, and there was plenty of oil.—C.E.L. de S.

The details you give are not very clear, and it is rather difficult to tell you exactly what is the cause of the knocking. You might make quite sure that the keyway in the flywheel and shaft are undamaged. As a matter of fact the makers have now discontinued the fitting of flywheel keys, and it would be advisable to leave out the key when reassembling the engine. You do not say how far the engine was dismantled, but we are inclined to believe that the trouble which you now experience is due to the shafts being disturbed and out of line, as a result of the pre-ignition which loosened the flywheel. Perhaps it would be best to return the engine for overhaul if you find that the above explanation is correct, as it may be damaged considerably if you continue to run it with the shafts out of alignment.

REMOVING OVERHEAD INLET VALVE.

I have a 1916 Harley-Davidson, and am desirous of grinding in the valves. I have managed, after considerable difficulty to remove what I will call the "domes" of the inlet valves. Now I am confronted with the difficulty of knowing how to proceed. Can you please give me the method of procedure in getting the plate out, which, to me, seems determined to stay where it is?—R.T.

Remove the exhaust valve cotter, cup and spring, and then raise the valve itself until it presses against the inlet valve. Then place a distance piece between the valve stem and the tappet, taking care that the latter is in its lowest position. By gently rotating the engine, the rising of the exhaust valve tappet will press the inlet valve seating out of its place.

SLIPPING FRICTION CLUTCH.

I ride a 3 h.p. Royal Enfield, and the two-speed gear defies all my attempts to repair it. New actuating pegs have been fitted, and the cam is in No. 3 position. Low gear keeps in position, but the high gear will not remain in action unless the lever is held in with hand or knee. Then there is a lot of slipping in high, and whenever a hill is tackled the engine races without the machine increasing in speed, no matter what pressure is exerted on the lever. I think I have carried out all instructions given in the makers' handbook, but all to no avail.—F.S.

In all probability the slipping on high gear has nothing to do with the countershaft gear itself; it appears to be the high gear sprocket on the engine-shaft. If you study the handbook issued by the makers you will observe that this is arranged as a slipping device in order to eliminate shocks on high gear, and the pressure on the springs should be increased or new ones fitted.

NO SPARK AT FULL RETARD.

I have an old pattern twin magneto, which I am using for a single, after removing one carbon brush and one rocker arm opener. I get a good spark when the ignition lever is fully advanced, but a very weak spark when I retard the lever. My engine is an old 3½ h.p. P.F., and I cannot get it to run slowly. Of course, it has a fixed gear, so I thought if I got a good spark when fully retarded it would run more slowly.—W.R.

Probably the weak spark on full retard is due to a defect in the design of the magneto, and it is doubtful whether you could improve this. The fact that the engine will not run slowly is more likely to be due to defective carburation resulting from an air leak in the induction system than to the ignition. Make quite sure that there are no leaks at the induction pipe joints, or at the inlet valve stem where it passes through the guide.

LUBRICATION.

Having just taken delivery of a 2¾ h.p. British Excelsior two-speed model, with J.A.P. engine, I am lubricating with Vacuum oil B.B., and would like to know (1) the correct setting of drip feed lubricator until engine is run in? (2.) Correct setting of drip feed lubricator after engine is run in? (3.) Correct lubricant for Albion two-speed gear box? (4.) How often will the gear box need refilling with fresh lubricant?—G.D.W.

(1.) Setting of the drip feed lubricator depends altogether on circumstances—normal speed, nature of the load, quality of oil, and temperature, all having to be taken into account. Your average consumption of oil should be about 200 miles per quart, and you might set the drip regulator to deliver thirty drops per minute. If the engine smokes on this quantity you can cut it down slightly, or you may find that it needs a little more to get the best running. (2.) After the engine has done five or six hundred miles you should be able to get about 300 miles per quart oil consumption. (3.) Ordinary engine oil will suit the gear box. (4.) About every five hundred miles. The gear box should not be more than half filled.

TESTING PETROL LEVEL.

Will you kindly criticise the following suggestion for checking the petrol level of an ordinary carburetter, and also give me the information *re* gear? (1.) Assuming the correct level is $\frac{1}{16}$in. below the jet top, and that the float displaces the same amount of petrol, whatever its height, run the engine a few moments to ensure the needle valve seating, turn off the petrol and carefully remove the float; mark at what height the petrol stands in the float chamber. Next fit up carburetter and flood well, allow plenty of time for the excess petrol to escape, then again remove float and mark new level. If the difference between the marks is $\frac{1}{4}$in., then the level requires raising $\frac{3}{16}$in. (2.) What gear do you recommend for top, with a 4¼ h.p. B.S.A. sidecar outfit (weighing about 4 cwt.), in not very hilly country?—P.B.

(1.) Your suggested method of ascertaining the petrol level does not appear to be altogether reliable. The usual plan is to remove the float chamber and jet platform complete from the carburetter, and connect it up to the tank by means of the petrol pipe. When the fuel is turned on it is quite easy to notice whether the petrol reaches to within the required distance of $\frac{1}{16}$in. from the top of the jet. (2.) The most suitable top gear ratio is 4⅞ to 1 if the machine is to be used on ordinary undulating roads. In a very hilly district a 5 to 1, or 5¼ to 1 is more suitable.

READER'S REPLY.

REMOVING RUST.

I noticed in "Questions and Replies," a few weeks ago, an enquiry from a correspondent as to whether there is any known composition that will take the rust off nickel plating. Perhaps your correspondent may be interested to hear of a substance I obtained over a year ago from Messrs. A. W. Gamage. It is a blue powder called "Rustoff"; when mixed to a paste and applied, it will quickly remove any rust from nickel plating. I should say it is a very fine emery or Carborundum powder, but it does not scratch the plating in the least, and removes all dullness and tarnish. I cannot say whether the powder is still obtainable; but if your correspondent obtains any and makes use of it, I should most strongly advise him to apply one of the excellent transparent enamels now on the market, or grease the plating well after removing rust, or it will go rusty again all the more quickly.—A. H. NEWMAN.

EXPERIENCES WANTED.

"G.M.W."—8 h.p. 1920-21 Clyno outfit, freedom from mechanical noise at all speeds, reliability, springing, electric lighting.

RECOMMENDED ROUTES.

BEDFORD TO BISLEY.—R.T.G.

Bedford, Ampthill, Westoning, Toddington, Dunstable, Ivinghoe, Tring, Chesham, Amersham, Beaconsfield, Slough, Windsor, Ascot, Bagshot, Bisley.

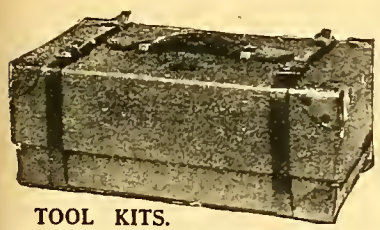
ASHBY-DE-LA-ZOUCH TO MARKET DRAYTON.—W.K.

Ashby-de-la-Zouch, Burton-on-Trent, Newborough, Abbotts Bromley, near Colewick, Weeping Cross, Stafford, Eccleshall, Market Drayton. Approximately 53 miles.

LEICESTER TO GREENOCK.—W.U.

Leicester, Loughborough, Nottingham, Mansfield, Worksop, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Leeming, Catterick, Scotch Corner, Barnard Castle, Middleton-in-Teesdale, Alston, Brampton, Longtown, Gretna Green, Lockerbie, Beattock, Abington, Lesmahagow, Hamilton, Glasgow, Dumbarton, Greenock.

STAFFORD TO FARNBOROUGH.—F.J.M.



Stafford, Rugeley, Lichfield, Weeford, along Watling Street for a short distance, then through Nether Whittacre to Coventry, Southam, Banbury, Oxford, Shillingford, Benson, Nettlebed, Henley, Bracknell, Bagshot, Farnborough. Approximately 143 miles.

WALLSEND-ON-TYNE TO BRIXTON (LONDON).—W.R.S.

Wallsend, Newcastle, Chester-le-Street, Neville's Cross, Darlington, Northallerton, Boroughbridge, Wetherby, Aberford, Ferrybridge, Doncaster, Bawtry, Retford, Tuxford, Newark, Grantham, Stamford, Wansford, Alconbury Hill, Buckden, Eaton Socon, Biggleswade, Baldock, Stevenage, Welwyn, Hatfield, Barnet, Regent's Park, Portland Place, Regent Street, Waterloo Place, Trafalgar Square, Whitehall, Westminster Bridge, Westminster Bridge Road, Kennington, Brixton. Approximately 279 miles.

Well known to Wolverhampton, Kidderminster, and Stourbridge motor cyclists—the Stewponey Hotel, established in the reign of Queen Anne, and an important scene in S. Baring Gould's novel, "Bladys of the Stewponey." Mine host is one of the old brigade of roadfarers.

TOOL KITS.

The "Dunhill." No. 8006/80. Contains best-made Tools in very neat kit with pockets—Tyre Levers, Belt Punch, Box Spanners, Screwdriver, Pliers, 2 Adjustable Spanners, File, Oilcan. Price complete, **30/-**

Too Roll o ly. No. 1629/80. Enables Customers to make up own kit. Price **4/6**

Valises.

No. 3022. **Kennard Valise** made of best compressed fibre, covered with waterproof canvas or leather cloth, strengthened with an iron frame, fitted with dust proof lining. The most practical valise on the market. Expansible and indestructible. Water and dustproof.

Size 15½ × 8½ × 6½in

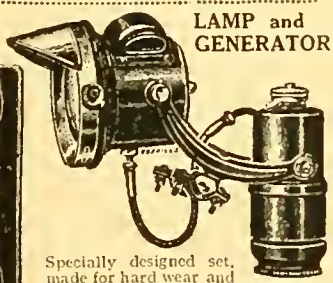
Price **45/-**

GOGGLES.

Pear-shaped collapsible goggles, best quality, silk sides, edge chenille No 1657/80. Price **4 6** per pair. Other shapes from **2/-** upwards. List on request

How to Order.

Use this page as your Order Form, simply mark a × against the item wanted tear out the page, write your name and address in the margin, pin on cheque or postal order and post to us. We pay carriage on retail orders over £2.



CATALOGUES.

The Dunhill Catalogue is full of interest, and a copy should be in the hands of every MotorCyclist. To secure YOURS simply write your name and address on the margin, tear it out, and post to us.

SIDECAR LAMP BRACKET (Adjustable) Registered.

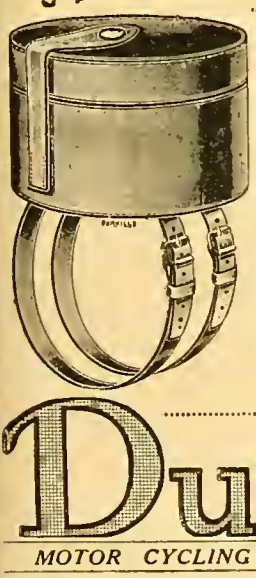
No. 2498/8n. Adjustable Sidecar Lamp Bracket. Tang is adjustable to any position. Bracket fits any make or shape Sidecar. Finished black enamel and nickel. Price **4/6**

LAMP and GENERATOR

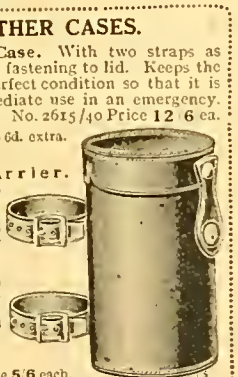
Specially designed set, made for hard wear and long service. Handle-bar fixing. Best quality, British made throughout. An exceptionally efficient, compact, durable and neat outfit. No. 2405/8c. Price **52/6** per set complete. Postage 1/- extra.

REAR LAMP. A very smart little lamp. Torpedo shape in Aluminium. No. 2138 80. With carrier fixing, **8 6** each. No. 2137/80 With number plate fixing, **8/6** each.

KNEE GRIPS. For attaching to petrol tank. This fitment adds great confidence and comfort, especially when riding at high speeds. Rubber or leather, padded. Price **10 6**



SIDECAR LAMP. Torpedo shape model for Acetylene, in polished aluminium, with side bracket fixing. Very light, yet extremely strong. No 2213/80. Price **11/8** each. Postage 6d. extra.



LEATHER CASES.

Spare Tube Case. With two straps as shown and snap fastening to lid. Keeps the spare tube in perfect condition so that it is ready for immediate use in an emergency. Strong but neat. No. 2615/40 Price **12 6** ea.

Postage 6d. extra.

Carbide Carrier. Made specially to carry in handy fashion a spare tin carbide. The two straps shown may be used for attaching to the machine, and a strong snap fastening is provided for the lid. Will take a tin 2¼in. in diameter by over 4in. deep

No. 2221/40 Price **5/6** each. Postage 6d. extra.

Motor Vehicles *for* Business Purposes

ANY readers of "The Motor Cycle" who are concerned with motor vehicles for the carrying or delivery of goods, or are interested in transport undertakings of any kind, should study the pages of "MOTOR TRANSPORT" each week.

This journal deals in a practical manner with all aspects of motor haulage and delivery. It is equally useful to the owner of a single van or lorry as to those who own or control fleets of vehicles.

Reliable and helpful information is provided for users and prospective users of motor road transport, for operating engineers and for drivers and mechanics.

Among the subjects dealt with are—Costs of Running various types of motor vehicles for trade and industrial purposes; Descriptions and Illustrations of new vehicles, components, and accessories, Care and Maintenance of business vehicles; Practical Notes for drivers and mechanics; Motor Transport finance, legal matters, etc.

A consulting staff is at the service of readers to give advice and information, *free of cost* on all transport matters.

If you are interested write to-day for a FREE SPECIMEN COPY mentioning "The Motor Cycle."

Proprietors: ILIFFE & SONS Ltd., 20, Tudor St., London, E.C.4.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, ½ %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.
